

UNIVERSITI SAINS MALAYSIA  
Master of Business Administration

Second Semester Examination  
Academic Session 1995/96

April 1996

**AGW606 - CORPORATE FINANCE**

Time: [3 hours]

---

**INSTRUCTION:**

Please make sure that this examination paper consists of **EIGHT (8)** printed pages before you begin.

There are **SIX (6)** questions. Answer any **FOUR (4)** questions here.  
Question **ONE (1)** is **COMPULSORY**.

1. **Malaysian Great Resources (MGR)**

MGR is looking for a correct appraisal rates for appraising the operating cash flows of the following four projects:

Project 1 - scale expansion of MGR

Project 2 & 3 - expansion into two areas completely new to MGR and which are thought to have different risk levels from MGR's current activities.

Project 4 - most likely to be scale expansion

All four projects have expected lives of 5 - 7 years and the current pre tax interest rates for 5 years debt are about 10%. Tax rate is 40%. MGR's financial structure for many years has been 30% debt, 70% equity. This financial structure will be adhered to for the foreseeable future.

It has been calculated that the average annual 'excess return' i.e. the excess of the market return over debt interest ( $r_m - r_f$ ), has been about 8%.

But MGR's management feels there are grounds for believing this excess return will increase in future and believe 10% to be a better indication of the average premium for bearing risk.

...2/-

The monthly returns on MGR's equity, and on the market index for the previous 24 months are:

Month	Percentage Return		Month	Percentage Return	
	(RS) MGR	(RM) Market		(RS) MGR	(RM) Market
1	2	2	13	6	6
2	-12	-6	14	18	16
3	-8	-6	15	-8	-2
4	6	10	16	18	10
5	10	16	17	-6	6
6	-2	2	18	14	-12
7	-10	-10	19	6	4
8	-4	-4	20	10	8
9	12	10	21	-6	-10
10	6	2	22	-12	-14
11	1	-2	23	14	6
12	-4	-6	24	-16	-14

MGR has identified two firms which operate only in the industries associated with projects 2 and 3. In each case the firm concerned has operated in those industries for many years.

Malaysian Juara Holdings (MJH) operates in the industry associated with project 2 and Global Business Synergy (GBS) with project 3. MJH has a beta of 1.6 and is all equity financed whereas GBS's equity has a beta of 0.8 and has a capital structure of 40% debt, 60% equity.

The expected after tax operating cash flows, which incorporate the best estimates of future inflation, for each of project 1, 2 & 3 are:

Project	Cost (\$000's)	Annual After Tax	Life Yrs
		Cash Flow (\$000's)	
1	210	60	5
2	80	20	7
3	60	15	6

(These cash flows already include the impact of capital allowances and tax on operating cash flows).

...3/-

The expected annual cash flows are subject to some variability and, if current economic conditions hold, the actual cash flows in any one year could be up to about 10% different from those expected. However, any differences are unlikely to be systematic and will probably tend to even out over the life of each project. Of course the expected cash flows will be altered by changes in economic conditions, generally.

MGR wishes to incorporate the tax advantages of debt into the discount rate and wishes, therefore, to determine the "weighted average cost of capital" for each project.

Project 4 has a cost of \$220,000 and future after tax operating cash flows will be at one of three possible levels:

Level	Annual After Tax Cash Flow (\$000's)	Life Yrs
Low	45	5
Most Likely	60	6
High	70	7

The 'Most Likely' and 'High' level of cash flows will display as much variability with general economic conditions as MGR's other activities but the 'low' level cash flow will have 20% greater variability i.e. the beta will be 20% higher.

Project 4 does not need to be operated for its full 5-7 year life. After tax salvage values are estimated at

Level	Salvage Value (\$000's)				
	Yr 1	Yr 2	Yr 3	Yr 4	Yrs 5
Low	90	100	-	-	-
Most Likely	195	150	100	40	-
High	210	180	120	60	-

Any salvage value would be received immediately after that year's operating cash flows. If project 4 was to be accepted it would be accompanied by considerable publicity and MGR would be reluctant to terminate the project before year 5 as this would cause some "loss of face".

The likelihood of each level of outcome for project 4 has been estimated at:

Low	0.20
Most Likely	0.60
High	0.20

Once determined the level of outcome will last for the whole of the project's life i.e. 5 to 7 years.

MGR's Financial Director is tempted to appraise project 4 by concentrating only on the "most likely" figures and using a hurdle rate of 4% above MGR's usual test discount rate to allow for the extra risk.

Note 1: The After Tax cash flows for all projects incorporate the impact of any capital allowances. The "salvage value" shown for project 4 also incorporate the full impact of any tax effects.

Note 2:  $\beta = \frac{n (\Sigma R_m R_s) - (\Sigma R_m)(\Sigma R_s)}{n(\Sigma R^2_m) - (\Sigma R_m)^2}$

You are asked to assist MGR in determining the appraisal discount rates and advise MGR on the financial desirability of project 1, 2 and 3.

OR

You are asked to assist MGR in determining the appraisal discount rates and advise MGR on the desirability of project 4, both with and without the salvage value option.

[34 marks]

2. Brealey & Myers said "it is all very well telling companies to maximise net present value, but net present value is just an abstract notion. What I tell my managers is that profits are what matters and it is profit that we are going to maximise".

Elaborate further on the above-mentioned statement, and discuss how corporate financial strategies and decisions affect the firm's values. Exemplify potential conflicts of interest between the goals of managers and shareholders.

[22 marks]

...5/-

3. Richard Pike & Bill Neale said "it is the task of those involved within the finance function to plan, raise and use funds in an efficient manner to achieve corporate financial objectives"

Indicate how a corporate finance section interfaces with the overall firm's management. Discuss a scenario of the interface by making use of SWOT analysis,

[22 marks]

4. B Huntsman and J P Hobar Jr said "for every 10 first-stage venture capital investments, only two or three may survive as successful, and self-sufficient businesses. From this statistic come two rules for success in venture capital investment. First, don't shy away from uncertainty; accept a low probability of success. But don't buy into a business unless you can see the chance of a big, public company in a profitable market. There is no sense taking a long shot unless it pays off big if you win. Second, cut your losses; identify losers early, if you cannot fix the problem - by replacing management, for example - throw no good money after bad"

Argue further the above two rules for success in venture capital investment. Based on your experience, discuss the progress that has been made in Malaysia towards the development and success of venture capital as a source of financing.

[22 marks]

5. E L Winter said "many investment bankers and institutional investors argue that underpricing is in the interests of the issuing firm. They say that a low offering price on the initial offer raises the price of the stock when it is subsequently traded in the market and enhances the firm's ability to raise further capital. At least one industrialist has accepted this argument, by writing some time after his company went public, the President described the pricing decision as follows:

Our underwriting group suggested a price of \$15. The general market was strong ..... when our registration statement was filed and we felt that the public might well pay \$17 or \$18 for our stock rather than \$15. Our underwriters were strong in their desire to have the stock sold at \$15 a share on the basis that this was a proper price for the stock. They pointed out that the after-market was important and that the price could decline if stock was overpriced. Having practiced law for many years ..... it was always my opinion that clients should not second-guess their counsellors. I had to follow the same rules in accepting the advice of our

...6/-

investment bankers. And how right our underwriting group was! Within six months our stock rose from \$15 a share to \$50. Would the stock have had this dramatic increase if the initial price had been \$17 or \$18? There may have been some who felt that it was overpriced initially and would not have been in the market for our stock. Suffice it to say that the overall result was extremely good. It points out the importance of working with competent investment bankers who guide you in these matters."

Give your opinion whether you agree with the aforesaid statement. Discuss your justification by using some of local IPOs.

[22 marks]

6. Discuss any FOUR of the following concepts in the context of financial strategies and decisions:

- (a) Mezzanine financing
- (b) CAPs
- (c) Financial engineering
- (d) Convertible unsecured loan stocks (ICULS/or RULS)
- (e) Black-Scholes Model
- (f) Agency theory
- (g) Debt-equity swaps
- (h) corporate sell-off
- (i) Euro-bonds.
