Taburan Poisson

X menandakan suatu pembolehubah dengan suatu taburan Poisson yang mempunyai jangkaan μ . Sifir ini memberikan nilai $P(X = k) = (e^{-\mu} \mu^k / k!)$ bagi berbagai nilai k dan μ .

Contoh. Untuk $\mu = 1.0$,

$$P(X = 1) = .368$$

$$P(X = 3) = .061$$

$$P(X \leq 2) = P(X = 0) + P(X = 1) + P(X = 2)$$

$$= .368 + .368 + .184$$

$$= .920$$

Wilcoxon table

This table gives the significance probabilities for the Wilcoxon signed-rank test for paired comparisons, for various selected values of the test statistic W = sum of all signed ranks. The significance probabilities included in the table are the ones closest to the commonly used levels of significance $\alpha = .10$, $\alpha = .05$, and $\alpha = .01$. Thus the table may be used to obtain the appropriate critical value of W for a given value of α , the level of significance.

The critical values c in the table correspond to the critical value for a one-sided test which rejects for large values of W . If the test is one-sided, and rejects for small (negative) values of W , then the critical value is $-c$, where c is the value in the table for which $P(W \geq c) =$ desired level of significance. If the test is two-sided, then the critical value c is determined by finding the value in the table for which $P(W \geq c) = 1/2 \alpha$, where α is the desired level of significance. In this case the test is to reject H_0 if $W \leq -c$ or $W \geq c$.

Example

- (a) The test is one-sided and rejects for large values of W . Suppose $\alpha = .05$ and $n = 8$. Then the critical value is $c = 24$, since $P(W \geq c) = .055$, and .055 is closest to the desired level $\alpha = .05$. Thus, the test rejects H_0 if $W \geq 24$, and accepts otherwise.

- (b) The test is one-sided and rejects for small (negative) values of W . Suppose $\alpha = .10$ and $n = 12$. The critical value is -34 , since $P(W \geq 34) = .102$, and .102 is the value closest to .10. Thus the test rejects H_0 if $W \leq -34$.

- (c) The test is two-sided. Suppose $\alpha = .05$ and $n = 20$. Then the critical values are 106 and -106 , since $P(W \geq 106) = .024$, and .024 is the value closest to .025 ($= 1/2\alpha$). Thus the test rejects H_0 if $W \leq -106$ or $W \geq 106$.
