<sup>a</sup>Average runoff condition. Antecedent Moisture Condition (AMC) II, and Ia = 0.2S'.

<sup>b</sup>The average percent impervious area shown was used to develop the composite CNs. Other assumptions are as follows: impervious areas are directly connected to the drainage system, impervious areas have a CN of 98, and pervious areas are considered equivalent to open space in good hydrologic condition.

<sup>c</sup>CNs shown are equivalent to those of pasture. Composite CNs may be computed for other combinations of open space cover type.

<sup>d</sup>In some warmer climates, a curve number of 95 may be used.
