UNIVERSITI SAINS MALAYSIA

Peperiksaan Semester Kedua
Sidang Akademik 1993/94

April 1994

EKC 111 - Unsur-unsur Kejuruteraan Kimia

Masa : [3 jam]

Sila pastikan bahawa kertas peperiksaan ini mengandungi **TUJUH** soalan dan **ENAM** mukasurat serta **TIGA PULUH SATU** helaian Lampiran bercetak sebelum anda memulakan peperiksaan ini.

Jawab **LIMA** soalan : **DUA** soalan dari Bahagian A dan
TIGA soalan dari Bahagian B

Semua soalan mesti dijawab dalam Bahasa Malaysia

Sumbangan markah setiap soalan adalah **20 markah.**

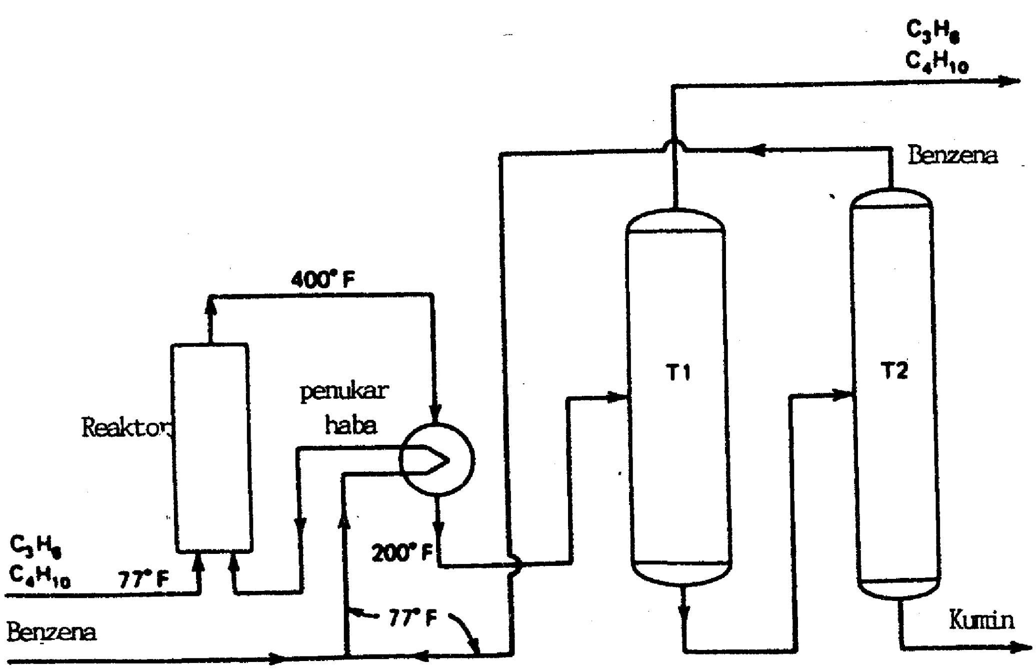
BAHAGIAN A

SOALAN NO. 1

Kumin ($C_6H_5C_3H_7$) dihasilkan daripada tindakbalas benzena dan propilina di dalam reaktor mangkin dasar tetap. $\left[\Delta\hat{H}_r^o(77°F) = -39\ 520\ \text{Btu/lb - mol}\right]$.Suapan cecair mengandungi 75 mol % propilina dan 25% butena dan arus cecair kedua mengandungi benzena tulen disuapkan ke dalam reaktor. Benzena segar dan benzena kitar semula, kedua-duanya pada suhu 77°F, dicampurkan mengikut nisbah 1:3 dan masuk menerusi penukar haba di mana kedua-duanya dipanaskan oleh efluen reaktor sebelum disuapkan ke dalam reaktor. Efluen reaktor masuk ke dalam penukar haba pada 400°F dan keluar pada 200°F. Tekanan di dalam reaktor cukup untuk mengekalkan arus efluen sebagai cecair.

Selepas disejukkan di dalam penukar haba, efluen reaktor disuapkan ke turus penyulingan. Propilina yang tidak bertindakbalas dan semua benzena dikeluarkan sebagai hasil atas (over head product) dari turus. Benzena yang tidak bertindakbalas dan kumin dikeluarkan sebagai hasil bawah (bottoms product) dan disuap pada turus penyulingan kedua di mana mereka dipisahkan. Benzena yang meninggalkan bahagian atas turus kedua dikitar semula dan bercampur dengan suapan benzena segar. Kadar penghasilan kumin adalah 1200 lb_m/j.

Carta aliran dan data muatan haba seperti berikut:



Data proses:

Kadar penghasilan = 1200 lb_m of kumin/j

$C_p(Btu/lb_m.^oF)$ = 0.57 propilina

= 0.55 butena

= 0.45 benzena

= 0.40 kumin

(a) Hitung kadar aliran jisim bagi arus-arus suapan ke reaktor, kadar aliran molar dan komposisi efluen reaktor, dan kadar aliran molar hasil atas (over head product) turus penyulingan pertama.

(b) Hitung suhu arus benzena yang disuap ke reaktor, dan keperluan haba tambahan kepada atau buangan daripada reaktor.

SOALAN NO. 2

Dua ratus kilogram per jam larutan akues mengandungi 20 mol% natrium asitat ($NaC_2H_3O_2$) memasuki penyejat penghabluran pada suhu 60°C. Apabila larutan didedahkan kepada tekanan rendah di dalam penyejat, 16.9% air disejat, memekatkan baki larutan dan membentuk habluran natrium asitat trihidrat ($NaC_2H_3O_2.3H_2O$). Hasil tersebut adalah campuran seimbang hablur dan satu larutan akues tepu mengandungi 15.4 mol% $NaC_2H_3O_2$. Efluen (hablur, larutan dan wap air) semuanya berada pada suhu 50°C.

(a) Hitung kadar suapan ke penghablur dalam kmol/j.

(b) Hitung kadar hasilan (kg/j) hablur trihidrat dan kadar aliran jisim (kg/j) larutan cecair di mana hablur terampai.

c) Anggarkan kadar aliran haba (kJ/j) yang mesti dipindah kepada atau daripada penghablur, menggunakan data ciri fizikal di bawah:

$$(C_p)_{semua\ larutan} = 3.5\ kJ / kg.^oC$$

$$(C_p)_{hablur} = 1.2\ kJ / kg.^oC$$

$$(C_p)_{H_2O(v)} = 32.4\ / kJ.^oC$$

$$(\Delta\hat{H}_v)_{H_2O} = 4.39 \times 10^4\ kJ / kmol$$

Haba larutan bagi anhidrous natrium asitat

$$\Delta\hat{H}_s(25^oC) = -1.71 \times 10^4\ kJ / kmol\ NaC_2H_3O_2(s)$$

Haba penghidratan: $NaC_2H_3O_2(s) + 3H_2O(l) \rightarrow NaC_2H_3O_2.3H_2O(s)$

$$\Delta\hat{H}(25^oC) = -3.66 \times 10^4\ kJ / kmol\ NaC_2H_3O_2$$

SOALAN NO. 3

Minyak bahan api disuapkan ke dalam relau dan dibakar dengan 25% lebihan udara. Minyak tersebut mengandungi 87.0 wt% C, 10.0% H, and 3.0% S. Analisis gas buangan relau menunjukkan hanya N_2, O_2, CO_2, SO_2 dan H_2O. Kadar pengeluaran sulfur dioksida dikawal dengan menggahar (scrub) gas buangan, di mana kebanyakan SO_2 diserap ke dalam larutan alkali. Gas-gas yang keluar daripada penggahar (scrubber) tersebut (N_2, O_2, CO_2 dan sebahagian SO_2 dan H_2O masuk ke unit) keluar ke cerobong. Penggahar tersebut mempunyai muatan terhad sehingga satu pecahan gas buangan mesti di pirau terus ke cerobong.

Pada satu masa operasi proses tersebut, penggahar mengeluarkan 90% SO_2 dalam suapan gas, dan gas cerobong mengandungi 612.5 ppm (part per million) SO_2 kering iaitu setiap sejuta mol gas cerobong mengandungi 612.5 mol SO_2. Hitung pecahan gas buangan yang dipirau pada ketika ini.

BAHAGIAN B

SOALAN NO. 1

Satu campuran cecair mengandungi 40 mol% benzena dan 60% toluena diasingkan di dalam turus penyulingan. Wap dari atas turus yang mengandungi 95% benzena dimeluwapkan (condensed) dan dipisahkan kepada dua pecahan sama. Satu diambil sebagai aliran hasil atas (over head product stream), dan satu lagi (**refluks**) dikitar semula ke bahagian atas turus. Aliran hasil atas mengandungi 90% benzena asal disuapkan kepada turus. Cecair yang keluar dari bawah turus disuap pula ke pengulang didih separa (partial reboiler), di mana 45% daripada cecair tersebut diwapkan. Wap yang dihasilkan daripada pengulang didih dikembalikan ke bahagian bawah turus dan cecair sisa dikeluarkan sebagai hasil aliran bawah (bottom product stream). Komposisi aliran yang meninggalkan pengulang didih ditentukan dengan hubungan berikut:

$$\frac{y_B/(1-y_B)}{x_B/(1-x_B)} = 2.25$$

Aliran y_B dan x_B, masing-masing adalah pecahan mol benzena dalam aliran wap dan cecair. Berdasarkan 100 mol suapan ke turus, hitung kadar aliran molar aliran hasil atas (over head product stream) serta kadar aliran molar dan pecahan molar benzena dalam aliran hasil bawah (bottom product stream), aliran wap kitar semula ke turus daripada pengulang didih dan aliran cecair yang meninggalkan bahagian bawah turus.

SOALAN NO. 2

Metanol dihasilkan daripada tindakbalas karbon monoksida dan hidrogen pada 644 K melalui mangkin $ZnOCr_2O_3$. Satu campuran CO dan H_2 di dalam nisbah (2 mol H_2/mol CO) dimampatkan dan disuap kepada lapisan mangkin pada 644 K dan 34.5 MPa (mutlak). Hasil gas dilalukan melalui pemeluwap (condenser), di mana metanol dicecairkan. Penukaran sehala (single-pass conversion) 25% diperolehi. Halaju ruang, atau nisbah kadar aliran volumetrik gas suapan kepada isipadu lapiran mangkin ialah (25 000 m^3/j)/(1m^3 lapisan mangkin).

(a) Anda merekabentuk reaktor untuk menghasilkan 545 kmol CH_3OH/j. Anggarkan kadar aliran volumetrik yang boleh dihasilkan oleh pemampat jika tiada gas dikitar semula dan isipadu sebenar lapisan mangkin yang diperlukan (digunakan undang-undang Kay's untuk mengira tekanan isipadu)

(b) Jika gas daripada pemeluwap dikitar semula kepada reaktor, pemampat perlu menghasilkan hanya suapan segar. Apakah kadar aliran volumetrik perlu dihasilkan dengan andaian bahawa hasil metanol diperolehi sepenuhnya dari pemeluwap?

SOALAN NO. 3

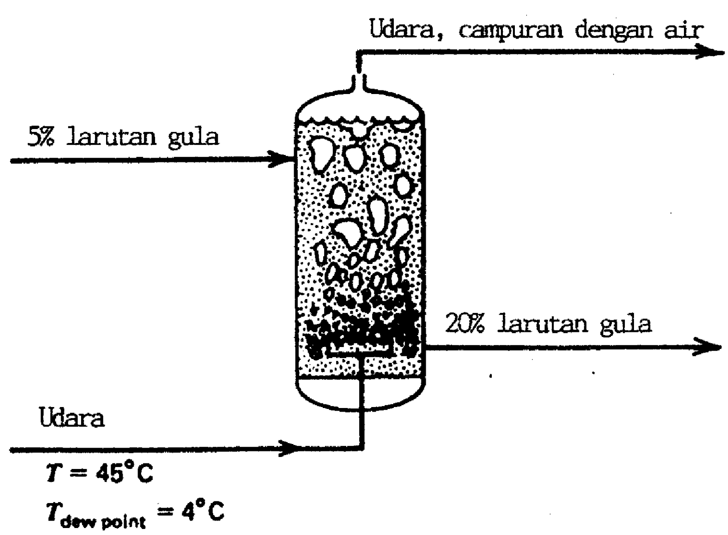
n-Butana ditukar kepada isobutana di dalam rektor pengisomeran yang beroperasi pada suhu 149°C.

(a) Hitung haba tindakbalas pengisomeran pada suhu 149°C, menggunakan jadual standard haba pembentukan n-butana dan isobutana.

(b) Sekiranya suapan ke reaktor mengandungi 93 mol% n-butana, 5% isobutana dan 2% HCl pada 149°C, dan 40% penukaran n-butana dicapai.
Apakah kadar haba [dalam kJ/m^3 (STP) suapan] yang perlu dibekalkan kepada atau dikeluarkan daripada reaktor?

SOALAN NO. 4

Satu larutan gula di dalam air dipekatkan daripada 5 wt% gula kepada 20%. Larutan tersebut disuap selanjar ke dalam sebuah turus gelembung. Udara pada suhu 45°C dengan suhu titik embun 4°C digelembungkan melalui turus dan menepu. Kelembapan udara dianggap adiabatik.



Gunakan carta psikrometrik untuk menyelesaikan masalah berikut:

(a) Apakah kelembapan mutlak udara keluar dan udara masuk?

(b) Berapa kilogram udara kering dmesti disuap per kilogram laurtan gula yang masuk? Apakah isipadu sepadan udara lembap yang masuk?

TABLE B.2
Heat Capacities[a]

Form 1: C_p(J/mol·°C) or (J/mol·K) $= a + bT + cT^2 + dT^3$
Form 2: C_p(J/mol·°C) or (J/mol·K) $= a + bT + cT^{-2}$

Example: $(C_p)_{\text{acetone(g)}} = 71.96 + (20.10 \times 10^{-2})T - (12.78 \times 10^{-5})T^2 + (34.76 \times 10^{-9})T^3$, where T is in °C.

Note: The formulas for gases are strictly applicable at pressures low enough for the ideal gas law to apply.

[a] Adapted from Haywood, *Thermodynamic Tables in SI (Metric) Units*, Cambridge University Press, London, 1968. Water is a liquid in the enclosed region between 50°C and 350°C. $\hat{H}$ = specific enthalpy (kJ/kg), $\hat{U}$ = specific internal energy (kJ/kg), $\hat{V}$ = specific volume (m^3/kg). *Note*: kJ/kg × 0.4303 = Btu/lb_m.
