**SCREENING OF AGRO-WASTES AS GROWTH SUBSTRATE,
QUANTIFICATION AND ANTIMICROBIAL ACTIVITY OF
BIOACTIVE METABOLITES OF *LACTOBACILLUS* SPECIES**

by

HASSAN PYAR ALI HASSAN

**Thesis submitted in fulfillment of the requirements for the degree of
Doctor of Philosophy**

June 2015

This thesis is dedicated to.....

My beloved parents, all family members and my wife.....

ACKNOWLEDGEMENTS

I would like to express my utmost gratitude and appreciation to my dedicated supervisor Professor Dr Peh Kok Khiang for his continuous effort, guidance and patience in providing ideas and encouragement, in making this project a success. I am grateful to my co-supervisor Associate Professor Dr. Liong Min-Tze who gave good insight on the project.

I express my sincere gratitude to the Dean of Institute of Postgraduate Studies for Graduate Assistance Scheme and USM-RU-PRGS Grant (1001/PFARMASI/843084). My appreciation to the Dean of School of Pharmaceutical Sciences, USM, for giving me the opportunity and providing me with all the necessary facilities that made my study possible. Many thanks go to Associate Professor Dr. Pazilah Ibrahim for allowing me to use microbiology laboratory.

I would like to thank Dr. Siti Hawa, the head of Pathology Department, General Hospital, Penang, for her kind assistance and help to collect the bacteria used in this study. My thanks to Dr. Wan Norhana and Ms. Masazurah from Fisheries Research Institute, Penang, Malaysia. Thanks to Dr. Nazri, Dr. Gan and Dr. Leong from Doping Control Centre, for providing advice on the experiment. Many thanks to laboratory assistants and administrative staff from the School of Pharmaceutical Sciences and School of Technology Industry for helping me in one way or another either directly or indirectly throughout my research.

I am indebted to Hadramout University of Science and Technology, Mukalla, Yemen for the grant of necessary study leave without which it would have been difficult to complete my study. I express my sincere gratitude to the Dean of College of Environmental Science and Marine Biology, Hadramout University for his constant encouragement.

My heartfelt appreciation to my parents and all my family members for the warm support they gave me during my research including the late Uncle Salem and Sabri. I express my abiding love and gratitude for their sacrifices. This acknowledgement would be incomplete without reference to the firm support and deep understanding of my wife. Indeed, when it comes to thanking my family. I am at a loss for words for their understanding, constant encouragement, boundless affection and moral support throughout my study.

Last but not the least, I am grateful to all colleagues and friends who have helped me in one way or another, throughout my research and my stay in Malaysia for their cooperation, help, encouragement and support.

Hassan Pyar

CHAPTER 1: INTRODUCTION

1.1	Overview	1
1.2	Problem statement	2
1.3	Experimental work and scope of the study	4

CHAPTER 2: LITERATURE REVIEW

2.1	Agricultural wastes	6
2.1.1	Honeydew	7
2.1.2	Guava	7
2.1.3	Mango	8
2.1.4	Cabbage	8
2.1.5	Pineapple	9

2.1.6	Papaya	9
2.2	Probiotics	10
2.3	Generally Recognized as Safe (GRAS) microorganism	14
2.4	<i>Lactobacillus</i>	14
2.4.1	Characteristics of <i>Lactobacillus</i>	15
2.4.2	Identification of <i>Lactobacillus</i>	15
2.4.2.1	Morphological identification	16
2.4.2.1 (a)	Taxonomy	16
2.4.2.1 (b)	Cell morphology	17
2.4.2.1 (c)	Colony morphology	17
2.4.2.2	Biochemical characterization	19
2.4.2.2 (a)	Indole test	19
2.4.2.2 (b)	Voges-Proskauer test	19
2.4.2.2 (c)	Citrate test	19
2.4.2.2 (d)	Carbohydrate fermentation test	19
2.4.2.2 (e)	Analytical profile index (API) kit	20
2.4.2.3	Other conventional tests	20
2.4.2.3 (a)	Gram staining test	20
2.4.2.3 (b)	Spore staining test	21
2.4.2.3 (c)	Motility test	21
2.4.2.4	Molecular identification by 16S ribosomal deoxyribonucleic acid (rDNA)	21
2.4.2.4 (a)	Polymerase chain reaction (PCR)	21
2.4.2.4 (b)	Gel electrophoresis	23
2.4.2.4 (c)	Sequencing	24
2.5	Factors affecting growth of <i>Lactobacillus</i> species	25

2.5.1	Effect of growth temperature	25
2.5.2	Effect of medium pH	26
2.5.3	Effect of agitation rate	27
2.5.4	Effect of inoculum size	27
2.5.5	Effect of medium composition on <i>Lactobacillus</i> viability	27
2.5.5.1	Carbon sources	28
2.5.5.2	Nitrogen sources	29
2.5.5.3	Minerals and trace elements	30
2.6	Protein identification using LC-MS/MS Orbitrap	31
2.7	Antimicrobial compounds produced by <i>Lactobacillus</i> species	33
2.7.1	Organic acid	33
2.7.2	Hydrogen peroxide	34
2.7.3	Diacetyl	35
2.7.4	Fatty acids	35
2.7.5	Bacteriocins	36

CHAPTER 3: CONFIRMATION OF IDENTITY OF *LACTOBACILLUS* AND EVALUATION OF TOLERANCE IN ACID AND BILE SALT

3.1	Introduction	40
3.2	Materials and Methods	40
3.2.1	Materials	40
3.2.2	Preparation of culture media	41
3.2.2.1	Man-Rogosa–Sharpe (MRS) broth	41
3.2.2.2	Man-Rogosa–Sharpe (MRS) agar	41
3.2.2.3	Motility test agar	42
3.2.2.4	Methyl-Red and Voges-Proskauer (MRVP) broth	42

3.2.2.5 Tryptone broth	42
3.2.2.6 Simmons citrate agar	42
3.2.2.7 Phenol red broth base	43
3.2.2.8 Methyl red solution	43
3.2.3 Bacteria cultures	43
3.2.4 Reviving bacterial culture	44
3.2.5 Enumeration of lactobacilli	44
3.2.6 Morphological evaluation	44
3.2.7 Biochemical tests	45
3.2.7.1 Catalase test	45
3.2.7.2 IMViC tests	45
3.2.7.2 (a) Indole production test	45
3.2.7.2 (b) Methyl red test	45
3.2.7.2 (c) Voges-Proskauer test	45
3.2.7.2 (d) Citrate test	46
3.2.7.2 (e) Carbohydrate fermentation test	46
3.2.8 Gram staining test	47
3.2.9 Spore staining test	47
3.2.10 Motility test	48
3.2.11 Screening and selection of lactobacilli	48
3.2.11.1 Determination of viable count	48
3.2.11.2 Determination of pH	49
3.2.12 Acid and bile salt tolerance tests	49
3.2.12.1 Acid tolerance test	49
3.2.12.2 Bile tolerance test	50
3.2.13 Statistical analysis	50

3.3	Results and Discussion	50
3.3.1	Morphological characteristics	50
3.3.2	Biochemical tests	51
3.3.2.1	Catalase test	51
3.3.2.2	IMViC tests	51
3.3.2.3	Carbohydrate fermentation test	52
3.3.3	Other characteristics	53
3.3.3.1	Gram staining test	53
3.3.3.2	Spore staining test	54
3.3.3.3	Motility test	54
3.3.4	Viability of bacteria cultures	55
3.3.5	Acid and bile salt tolerance tests	66
3.3.5.1	Acid tolerance test	66
3.3.5.2	Bile salt tolerance test	70
3.4	Conclusion	76

CHAPTER 4: IDENTIFICATION OF *LACTOBACILLUS* SPECIES

4.1	Introduction	77
4.2	Materials and Methods	78
4.2.1	Materials	78
4.2.2	Preparation of reagents and buffers	78
4.2.2.1	McDowell-Trump fixative reagent	78
4.2.2.2	McFarland standard solution	79
4.2.3	Identification of <i>Lactobacillus</i> species	79
4.2.3.1	Scanning electron microscopy	79
4.2.3.2	API 50 CHL identification kit	80

4.2.3.3 Molecular 16S rDNA genotypic method	81
4.2.3.3 (a) DNA extraction	81
4.2.3.3 (b) Polymerase chain reaction amplification of 16S rDNA genes	82
4.2.3.3 (c) Agarose gel electrophoresis	83
4.2.3.3 (d) DNA sequencing	83
4.2.3.3 (e) Species identification	84
4.3 Results and Discussion	84
4.3.1 Scanning electron microscopy	84
4.3.2 Identification using API 50 CHL kit	86
4.3.3 Molecular identification of <i>Lactobacillus</i> species	89
4.3.3.1 16S rDNA gene amplification	89
4.3.3.2 Molecular species identification	90
4.3.3.3 Phylogenetic tree	91
4.3.3.4 Confirmation of identity	92
4.4 Conclusion	94

CHAPTER 5: SCREENING OF AGRO-WASTES AS GROWTH SUBSTRATE FOR *LACTOBACILLUS*

5.1 Introduction	95
5.2 Materials and Methods	96
5.2.1 Materials	96
5.2.2 Optimization of cultivation condition of lactobacilli culture	96
5.2.2.1 Effect of incubation temperature	96
5.2.2.2 Effect of initial pH of medium	97
5.2.2.3 Effect of inoculum size	97
5.2.2.4 Effect of agitation rate	97

5.2.3 Agro-waste substrates	97
5.2.4 Proximate analysis	98
5.2.4.1 Water content determination	98
5.2.4.2 Crude protein determination	98
5.2.4.2 (a) Digestion	98
5.2.4.2 (b) Distillation	99
5.2.4.2 (c) Titration	99
5.2.4.3 Crude lipid determination	100
5.2.4.4 Crude fibre determination	100
5.2.4.5 Total ash determination	101
5.2.4.6 Nitrogen-free extract (carbohydrate) determination	101
5.2.4.7 Gross energy determination	101
5.2.5 Preparation of agro-wastes as growth substrates	102
5.2.5.1 Honeydew skin	102
5.2.5.2 Guava skin	102
5.2.5.3 Mango skin	103
5.2.5.4 Cabbage leave	103
5.2.5.5 Pineapple skin	103
5.2.5.6 Papaya skin	104
5.2.6 Screening of agro-wastes as growth substrate	104
5.2.6.1 Determination of pH	104
5.2.6.2 Determination of acidity	104
5.2.6.3 Determination of biomass	105
5.2.6.4 Determination viable count	105
5.2.7 Antimicrobial activity	106

5.2.7.1	Test microorganisms	106
5.2.7.2	Preparation of extracellular and intracellular fluids	106
5.2.7.3	Evaluation of antimicrobial activity	106
5.2.8	Statistical analysis	107
5.3	Results and Discussion	107
5.3.1	Optimization of growth condition	107
5.3.1.1	Effect of cultivation temperature	107
5.3.1.2	Effect of initial pH of medium	110
5.3.1.3	Effects of inoculum size	113
5.3.1.4	Effect of agitation rate	116
5.3.1.5	Optimum cultivation condition	119
5.3.2	Proximate analysis of agro-wastes	119
5.3.3	Determination of growth parameters	120
5.3.3.1	Measurement of pH value of the medium	120
5.3.3.2	Determination of acidity	126
5.3.3.3	Determination of biomass dry cell weight	131
5.3.3.4	Determination of viable count	136
5.3.4	Comparison of agro-waste substrate over commercial MRS medium	141
5.3.5	Antimicrobial activity	141
5.3.6	Selection of pineapple skin as substrate	150
5.4	Conclusion	151

CHAPTER 6: EVALUATION OF MEDIUM NUTRIENTS AND DEVELOPMENT OF NEW SELECTIVE PINEAPPLE SKIN MEDIUM FOR *LACTOBACILLUS* GROWTH

6.1	Introduction	152
6.2	Materials and Methods	152

6.2.1 Materials	152
6.2.2 Preparation of pineapple skin	153
6.2.3 Protein, sugar and trace elements analysis of pineapple skin	154
6.2.3.1 Determination of protein content	154
6.2.3.2 Determination of sugar content	154
6.2.3.2 (a) Reducing sugar content	154
6.2.3.2 (b) Total sugar content	155
6.2.3.2 (c) Non-reducing sugar content	155
6.2.3.3 Determination of trace elements	156
6.2.4 Preparation of pineapple skin medium	158
6.2.5 Effect of nutrients on viable count of lactobacilli cultured in pineapple skin	158
6.2.5.1 Effect of carbon source	158
6.2.5.2 Effect of nitrogen source	159
6.2.5.3 Effect of dipotassium hydrogen phosphate	159
6.2.5.4 Effect of sodium acetate	159
6.2.5.5 Effect of triammonium citrate	159
6.2.5.6 Effect of Tween 80	160
6.2.5.7 Effect of magnesium sulphate	160
6.2.5.8 Effect of manganese sulphate	160
6.2.6 Growth curve of <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i> after optimization	160
6.2.7 Statistical analysis	160
6.3 Results and Discussion	161
6.3.1 Determination of protein content in pineapple skin	161
6.3.2 Determination of sugar content in pineapple skin	162
6.3.3 Determination of trace elements in pineapple skin	163

6.3.4	Viable count of <i>Lactobacillus</i> species cultured in pineapple skin before and after drying.	167
6.3.5	Effect of nutrient on viable count of lactobacilli cultured in pineapple skin	168
6.3.5.1	Effect of carbon source	168
6.3.5.1 (a)	Effect of glucose concentration	170
6.3.5.2	Effect of different nitrogen sources	173
6.3.5.2 (a)	Effect of yeast extract, skim milk, beef extract and peptone (YSBP) mixture	176
6.3.5.2 (b)	Effect of YSBP mixture concentration	179
6.3.5.3	Effect of dipotassium hydrogen phosphate concentration	182
6.3.5.4	Effect of sodium acetate concentration	185
6.3.5.5	Effect of triammonium citrate concentration	187
6.3.5.6	Effect of Tween 80 concentration	190
6.3.5.7	Effect of magnesium sulphate concentration	193
6.3.5.8	Effect of manganese sulphate concentration	196
6.3.6	Development of selective pineapple skin medium	199
6.3.7	Growth profiles in newly developed pineapple skin medium	200
6.3.8	Cost comparison of newly developed pineapple skin medium and commercial MRS medium	202
6.4	Conclusion	204

CHAPTER 7: QUANTIFICATION OF EXTRACELLULAR BIOACTIVE METABOLITES OF *LACTOBACILLUS* SPECIES CULTURED IN NEWLY DEVELOPED SELECTIVE PINEAPPLE SKIN MEDIUM

7.1	Introduction	205
7.2	Materials and Methods	205
7.2.1	Materials	205

7.2.2 Preparation of extracellular fluid	206
7.2.3 Quantification of bioactive metabolites of extracellular fluid of <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i>	206
7.2.3.1 Lactic acid	206
7.2.3.1 (a) Instrumentation	207
7.2.3.1 (b) Chromatographic condition	207
7.2.3.1 (c) Preparation of lactic acid standard solutions for calibration curve	207
7.2.3.1 (d) Preparation of quality control (QC) standard solutions of lactic acid	208
7.2.3.1 (e) Precision and accuracy	208
7.2.3.1 (f) Sample preparation	208
7.2.3.2 Diacetyl	209
7.2.3.3 Hydrogen peroxide	209
7.2.3.3 (a) Reagent A: 10mM phosphate buffer	210
7.2.3.3 (b) Reagent B: Triton X-100 (0.4% v/v)	210
7.2.3.3 (c) Reagent C: o-dianisidine and Triton X-100 solution	210
7.2.3.3 (d) Reagent D: Peroxidase enzyme solution (POD)	210
7.2.3.3 (e) Cocktail solution	210
7.2.3.3 (f) Determination of H ₂ O ₂ concentration	211
7.2.3.4 Lipid	211
7.2.3.5 Exopolysaccharides	212
7.2.3.6 Protein	213
7.2.3.6 (a) Protein precipitation	213
7.2.3.6 (b) Determination of total protein concentration	214
7.2.4 Identification of protein	214
7.2.4.1 Protein separation with SDS-PAGE	214

7.2.4.1 (a) Preparation of sample loading buffer	214
7.2.4.1 (b) Preparation of staining solution	215
7.2.4.1 (c) Preparation of destaining solution	215
7.2.4.1 (d) Preparation of fixing solution	215
7.2.4.1 (e) Preparation of SDS-PAGE gel	215
7.2.4.1 (f) Gel electrophoresis	216
7.2.4.1 (g) Gel fixation	217
7.2.4.1 (h) Gel staining	217
7.2.4.1 (i) Gel destaining	217
7.2.4.1 (j) Qualitative assessment of SDS-PAGE bands	217
7.2.4.2 Identification with LC-MS/MS Orbitrap	218
7.2.4.2 (a) Preparation of trypsin solution	218
7.2.4.2 (b) Preparation of gel-washing solution	218
7.2.4.2 (c) Preparation of dithiothreitol solution	218
7.2.4.2 (d) Preparation of iodoacetamide solution	218
7.2.4.2 (e) In-gel trypsin digestion	218
7.2.4.2 (f) Sample analysis using LC-MS/MS Orbitrap	221
7.2.5 Statistical analysis	222
7.3 Results and Discussion	222
7.3.1 Determination of lactic acid content	222
7.3.2 Determination of diacetyl content	229
7.3.3 Determination of hydrogen peroxide content	230
7.3.4 Determination of lipid content	232
7.3.5 Determination of exopolysaccharides content	233
7.3.6 Determination of protein content	235

7.3.6.1 Protein precipitation	235
7.3.6.2 Determination of total protein	237
7.3.7 Identification of protein	238
7.3.7.1 SDS-PAGE	238
7.3.7.2 Protein identification using LC-MS/MS Orbitrap	240
7.3.8 Content of bioactive metabolites of extracellular fluid	246
7.4 Conclusion	247

CHAPTER 8: ANTIMICROBIAL ACTIVITIES OF EXTRACELLULAR FLUID AND BIOACTIVE PROTEIN OF *LACTOBACILLUS CASEI* CULTURED IN NEWLY DEVELOPED SELECTIVE PINEAPPLE SKIN MEDIUM

8.1 Introduction	248
8.2 Materials and Methods	248
8.2.1 Materials	248
8.2.2 Preparation of extracellular fluid	249
8.2.3 Preparation of MTT solution	249
8.2.4 Test microorganisms	249
8.2.5 Confirmation of pathogenic bacteria using molecular technique	249
8.2.6 Determination of antimicrobial activity	249
8.2.6.1 Extracellular fluid antimicrobial activity	249
8.2.6.2 Comparison of antimicrobial activity between lactic acid and protein	250
8.2.6.3 Growth inhibition and determination of IC ₅₀ of protein	250
8.2.6.4 Minimum inhibitory concentration (MIC)	251
8.2.6.5 Minimum bactericidal concentration (MBC) or minimal fungicidal concentration (MFC)	252
8.2.7 Statistical analysis	253
8.3 Results and Discussion	253

8.3.1 Identification using 16S rDNA gene amplification	253
8.3.2 Antimicrobial activity of bioactive metabolites	255
8.3.3 Comparison of antimicrobial effect of lactic acid and bioactive protein	256
8.3.4 Antibacterial activity assay	259
8.3.4.1 Growth inhibition and determination of IC ₅₀ of protein	259
8.3.4.2 MIC and MBC	261
8.4 Conclusion	263
CHAPTER 9: GENERAL CONCLUSION	264
CHAPTER 10: RECOMMENDATION FOR FURTHER WORK	
10.1 Application of newly developed selective pineapple skin medium for different lactic acid bacteria	267
10.2 Growth medium for commercial scale production of probiotics	267
10.3 As feed for poultry and aquaculture	267
10.4 Screening of other agro-waste substrates	267
10.5 Preparation of dermatological formulations	268

2.1 Common probiotics species.	12
2.2 Cell morphology, sizes and arrangements of common probiotics.	13
2.3 Characteristic of various <i>Lactobacillus</i> species (De Vos <i>et al.</i> , 2009).	17
2.4 Colony morphology of <i>Lactobacillus</i> species on specific media.	18
2.5 The various agarose concentrations for separation of different ranges of linear DNA molecules.	24
2.6 Terms used to describe microorganisms in relation to temperature requirements for growth.	26
3.1 Morphological and biochemical tests for <i>Lactobacillus</i> species.	52
3.2 Carbohydrate fermentation reactions.	53
3.3 Post-hoc Tukey-HSD test of viable counts of <i>Lactobacillus</i> species in pH 1.5 medium after 120 min.	67
3.4 Post-hoc Tukey-HSD test of the medium pH of <i>Lactobacillus</i> species in oxgall 0.5%w/v medium after 48 hr.	72
4.1 PCR parameters used in 16S rDNA gene amplification.	82
4.2 Carbohydrate fermentation profiles of <i>Lactobacillus</i> species.	86
4.3 Identification of <i>Lactobacillus</i> species based on carbohydrate fermentation profiles using API 50 CHL database.	88
4.4 Description of five <i>Lactobacillus</i> species after alignment.	90
4.5 List of <i>Lactobacillus</i> species sequence from NCBI GenBank.	92
5.1 Post-hoc Tukey-HSD analysis of viable counts of <i>L. brevis</i> at different temperature.	109
5.2 Post-hoc Tukey-HSD analysis of viable counts of <i>L. plantarum</i> at different temperature.	109
5.3 Post-hoc Tukey-HSD analysis of viable counts of <i>L. casei</i> at different temperature.	109
5.4 Post-hoc Tukey-HSD analysis of viable count of <i>L. brevis</i> at different initial pH of medium.	112

5.5	Post-hoc Tukey-HSD analysis of viable count of <i>L. plantarum</i> at different initial pH of medium.	112
5.6	Post-hoc Tukey-HSD analysis of viable count of <i>L. casei</i> at different initial pH of medium.	112
5.7	Post-hoc Tukey-HSD analysis of viable count of <i>L. brevis</i> at different inoculum size.	115
5.8	Post-hoc Tukey-HSD analysis of viable count of <i>L. plantarum</i> at different inoculum size.	115
5.9	Post-hoc Tukey-HSD analysis of viable count of <i>L. casei</i> at different inoculum size.	115
5.10	Post-hoc Tukey-HSD analysis of viable count of <i>L. brevis</i> at different agitation rate.	118
5.11	Post-hoc Tukey-HSD analysis of viable count of <i>L. plantarum</i> at different agitation rate.	118
5.12	Post-hoc Tukey-HSD analysis of viable count of <i>L. casei</i> at different agitation rate.	118
5.13	Proximate analysis of six different agro-wastes. Mean \pm SD, n = 3.	120
5.14	Post-hoc Tukey-HSD test on the pH value of six agro-waste substrates at 36 hr with <i>L. brevis</i> .	125
5.15	Post-hoc Tukey-HSD test on the pH value of six agro-waste substrates at 36 hr with <i>L. plantarum</i> .	125
5.16	Post-hoc Tukey-HSD test on the pH value of six agro-waste substrates at 36 hr for <i>L. casei</i> .	125
5.17	Post-hoc Tukey-HSD test on the acidity of six agro-waste substrates at 36 hr for <i>L. brevis</i> .	130
5.18	Post-hoc Tukey-HSD test on the acidity of six agro-waste substrates at 36 hr for <i>L. plantarum</i> .	130
5.19	Post-hoc Tukey-HSD test on the acidity of six agro-waste substrates at 36 hr for <i>L. casei</i> .	130
5.20	Post-hoc Tukey-HSD test of biomass of <i>L. brevis</i> in six agro-waste substrates at 36 hr.	135
5.21	Post-hoc Tukey-HSD test of biomass of <i>L. plantarum</i> in six agro-waste substrates at 36 hr.	135
5.22	Post-hoc Tukey-HSD test of biomass of <i>L. casei</i> in six agro-waste substrates at 36 hr.	135

5.23	Post-hoc Tukey-HSD test on the viable count in the agro-waste substrates at 36 hr for <i>L. brevis</i> .	140
5.24	Post-hoc Tukey-HSD test on the viable count in the agro-waste substrates at 36 hr for <i>L. plantarum</i> .	140
5.25	Post-hoc Tukey-HSD test on the viable count in the agro-waste substrates at 36 hr for <i>L. casei</i> .	140
5.26	Post-hoc Tukey-HSD test of inhibition zone diameter results for extracellular and intracellular fluids of <i>L. brevis</i> cultured in six agro-waste substrates against <i>S. aureus</i> .	144
5.27	Post-hoc Tukey-HSD test of inhibition zone diameter results for extracellular and intracellular fluids of <i>L. plantarum</i> cultured in six agro-waste substrates against <i>S. aureus</i> .	145
5.28	Post-hoc Tukey-HSD test of inhibition zone diameter results for extracellular and intracellular fluids of <i>L. casei</i> cultured in six agro-waste substrates against <i>S. aureus</i> .	146
5.29	Post-hoc Tukey-HSD test of inhibition zone diameter results for extracellular and intracellular fluids of <i>L. brevis</i> cultured in six agro-waste substrates against <i>E. coli</i> .	147
5.30	Post-hoc Tukey-HSD test of inhibition zone diameter results for extracellular and intracellular fluids of <i>L. plantarum</i> cultured in six agro-waste substrates against <i>E. coli</i> .	148
5.31	Post-hoc Tukey-HSD test of inhibition zone diameter results for extracellular and intracellular fluids of <i>L. casei</i> cultured in six agro-waste substrates against <i>E. coli</i> .	149
6.1	Microwave oven program.	157
6.2	The content of protein, total sugar and trace elements of pineapple skin.	167
6.3	Viable count of <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i> in pineapple skin before and after drying. Mean \pm SD, n=3.	168
6.4	Post-hoc Tukey-HSD analysis results of viable count of <i>L. brevis</i> with different carbon sources.	169
6.5	Post-hoc Tukey-HSD analysis results of viable count of <i>L. plantarum</i> with different carbon sources.	170
6.6	Post-hoc Tukey-HSD analysis results of viable count of <i>L. casei</i> with different carbon sources.	170
6.7	Post-hoc Tukey-HSD analysis results of viable count of <i>L. brevis</i> with different glucose concentration.	172

6.8	Post-hoc Tukey-HSD analysis of viable count of <i>L. plantarum</i> with different glucose concentration.	172
6.9	Post-hoc Tukey-HSD analysis of viable count of <i>L. casei</i> with different glucose concentration.	172
6.10	Post-hoc Tukey-HSD analysis results of viable count of <i>L. brevis</i> with different nitrogen sources.	174
6.11	Post-hoc Tukey-HSD analysis results of viable count of <i>L. plantarum</i> with different nitrogen sources.	175
6.12	Post-hoc Tukey-HSD analysis results of viable count of <i>L. casei</i> with different nitrogen sources.	175
6.13	Post-hoc Tukey-HSD analysis results of viable count of <i>L. brevis</i> of yeast extract, skim milk, beef extract, peptone and the mixtures (1:1:1:1).	178
6.14	Post-hoc Tukey-HSD analysis of viable count of <i>L. plantarum</i> with yeast extract, skim milk, beef extract, peptone and the mixtures (1:1:1:1).	178
6.15	Post-hoc Tukey-HSD analysis of viable count of <i>L. casei</i> with yeast extract, skim milk, beef extract, peptone and the mixtures (1:1:1:1).	178
6.16	Post-hoc Tukey-HSD analysis results of viable count of <i>L. brevis</i> with different YSBP concentration.	181
6.17	Post-hoc Tukey-HSD analysis results of viable count of <i>L. plantarum</i> with different YSBP concentration.	181
6.18	Post-hoc Tukey-HSD analysis results of viable count of <i>L. casei</i> with different YSBP concentration.	181
6.19	Post-hoc Tukey-HSD analysis results of viable count of <i>L. brevis</i> with different dipotassium hydrogen phosphate concentration.	184
6.20	Post-hoc Tukey-HSD analysis results of viable count of <i>L. plantarum</i> with different dipotassium hydrogen phosphate concentration.	184
6.21	Post-hoc Tukey-HSD analysis results of viable count of <i>L. casei</i> with different dipotassium hydrogen phosphate concentration.	184
6.22	Post-hoc Tukey-HSD analysis of viable count of <i>L. brevis</i> with different sodium acetate concentration.	186
6.23	Post-hoc Tukey-HSD analysis results of viable count of <i>L. plantarum</i> with different sodium acetate concentration.	186

6.24	Post-hoc Tukey-HSD analysis of viable count of <i>L. casei</i> with different sodium acetate concentration	186
6.25	Post-hoc Tukey-HSD analysis of viable count of <i>L. brevis</i> with different triammonium citrate concentration.	188
6.26	Post-hoc Tukey-HSD analysis of viable count of <i>L. plantarum</i> with different triammonium citrate concentration.	189
6.27	Post-hoc Tukey-HSD analysis of viable count of <i>L. casei</i> with different triammonium citrate concentration.	189
6.28	Post-hoc Tukey-HSD analysis of viable count of <i>L. brevis</i> with different Tween 80 concentration.	192
6.29	Post-hoc Tukey-HSD analysis of viable count of <i>L. plantarum</i> with different Tween 80 concentration.	192
6.30	Post-hoc Tukey-HSD analysis of viable count of <i>L. casei</i> with different Tween 80 concentration.	192
6.31	Post-hoc Tukey-HSD analysis of viable count of <i>L. brevis</i> with different magnesium sulphate concentration.	198
6.32	Post-hoc Tukey-HSD analysis of viable count of <i>L. plantarum</i> with different magnesium sulphate concentration.	195
6.33	Post-hoc Tukey-HSD analysis of viable count of <i>L. casei</i> with different magnesium sulphate concentration.	195
6.34	Post-hoc Tukey-HSD analysis of viable count of <i>L. brevis</i> with different manganese sulphate concentration.	198
6.35	Post-hoc Tukey-HSD analysis of viable count of <i>L. plantarum</i> with different manganese sulphate concentration.	198
6.36	Post-hoc Tukey-HSD analysis of viable count of <i>L. casei</i> with different manganese sulphate concentration.	198
6.37	Proposed newly developed selective pineapple skin medium.	200
6.38	Viable count of <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i> in newly developed pineapple skin medium and MRS medium.	202
6.39	Estimated costs of the ingredients used in the newly developed selective pineapple skin medium.	203
6.40	Cost comparison between MRS and newly developed selective pineapple skin medium.	203
7.1	Solutions for preparing 12%w/v resolving gels for SDS-PAGE.	216

7.2	Solutions for preparing 4% w/v stacking gels for SDS-PAGE.	216
7.3	Results of six standard calibration curves of lactic acid.	223
7.4	Results of precision and accuracy for lactic acid. n = 6.	224
7.5	Post-hoc Tukey-HSD analysis of lactic acid concentration of <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i> .	225
7.6	Summary of lactic acid concentration produced by <i>Lactobacillus</i> species in different media.	228
7.7	Post-hoc Tukey-HSD analysis of protein concentration of <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i> .	238
7.8	Molecular weight of each band from SDS PAGE.	239
7.9	Results of protein database searching in PEAKS using mass spectrometric results for band-I from SDS-PAGE.	241
7.10	Results of protein database searching in PEAKS using mass spectrometric results for band-II from SDS-PAGE.	241
7.11	Results of protein database searching in PEAKS using mass spectrometric results for band-III from SDS-PAGE.	242
7.12	Composition and concentration of bioactive compounds in extracellular fluid of <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i> .	246
8.1	The IC ₅₀ values of positive control and bioactive protein for microorganisms.	261
8.2	The MIC values of bioactive protein and positive control on bacteria and yeast.	262
8.3	The MBC/MFC values of bioactive protein and positive control on bacteria and yeast.	262

LIST OF FIGURES

	Page
2.1 The steps of one cycle in the polymerase chain reaction (PCR).	23
2.2 Growth rate versus pH of three types of bacteria grow over a pH range of about three units.	27
2.3 Image of Thermo - LTQ Orbitrap.	33
2.4 The molecular structures of linoleic acid and oleic acid.	36
3.1 Morphological characteristic of <i>Lactobacillus</i> FTDC 0785 colonies grown on MRS agar.	51
3.2 <i>Lactobacillus</i> FTDC 0785 observed under light microscope after Gram staining. Magnification: 1000x.	54
3.3 The growth profile of <i>Lactobacillus</i> FTDC 9393 in MRS medium for 48 hr. Mean \pm SD, n = 3.	56
3.4 The growth profile of <i>Lactobacillus</i> FTDC 0582 in MRS medium for 48 hr. Mean \pm SD, n = 3.	56
3.5 The growth profile of <i>Lactobacillus</i> FTDC 0785 in MRS medium for 48 hr. Mean \pm SD, n = 3.	57
3.6 The growth profile of <i>Lactobacillus</i> FTDC 4462 in MRS medium for 48 hr. Mean \pm SD, n = 3.	57
3.7 The growth profile of <i>Lactobacillus</i> FTDC 5127 in MRS medium for 48 hr. Mean \pm SD, n = 3.	58
3.8 The growth profile of <i>Lactobacillus</i> FTDC 5030 in MRS medium for 48 hr. Mean \pm SD, n = 3.	58
3.9 The growth profile of <i>Lactobacillus</i> FTDC 8891 in MRS medium for 48 hr. Mean \pm SD, n = 3.	59
3.10 The growth profile of <i>Lactobacillus</i> FTDC 4793 in MRS medium for 48 hr. Mean \pm SD, n = 3.	59
3.11 The growth profile of <i>Lactobacillus</i> FTDC 1295 in MRS medium for 48 hr. Mean \pm SD, n = 3.	60
3.12 The growth profile of <i>Lactobacillus</i> FTDC 8133 in MRS medium for 48 hr. Mean \pm SD, n = 3.	60
3.13 The growth profile of <i>Lactobacillus</i> FTDC 8264 in MRS medium for 48 hr. Mean \pm SD, n = 3.	61

3.14	The growth profile of <i>Lactobacillus</i> FTDC 2916 in MRS medium for 48 hr. Mean \pm SD, n = 3.	61
3.15	The growth profile of <i>Lactobacillus</i> FTDC 2804 in MRS medium for 48 hr. Mean \pm SD, n = 3.	62
3.16	The growth profile of <i>Lactobacillus</i> FTDC 1960 in MRS medium for 48 hr. Mean \pm SD, n = 3.	62
3.17	The growth profile of <i>Lactobacillus</i> FTDC 8592 in MRS medium for 48 hr. Mean \pm SD, n = 3.	63
3.18	The growth profile of <i>Lactobacillus</i> FTDC 3666 in MRS medium for 48 hr. Mean \pm SD, n = 3.	63
3.19	The growth profile of <i>Lactobacillus</i> FTDC 3871 in MRS medium for 48 hr. Mean \pm SD, n = 3.	64
3.20	The growth profile of <i>Lactobacillus</i> FTDC 1903 in MRS medium for 48 hr. Mean \pm SD, n = 3.	64
3.21	The growth profile of <i>Lactobacillus</i> FTDC 1861 in MRS medium for 48 hr. Mean \pm SD, n = 3.	65
3.22	The growth profile of <i>Lactobacillus</i> FTDC 8033 in MRS medium for 48 hr. Mean \pm SD, n = 3.	65
3.23	Effect of pH 1.5 on the viable count with time of nine <i>Lactobacillus</i> species. Mean \pm SD, n= 3.	68
3.24	Effect of pH 4.0 on the viable count with time of nine <i>Lactobacillus</i> species. Mean \pm SD, n= 3.	69
3.25	The pH values of nine <i>Lactobacillus</i> species in MRS medium without oxgall in 48 hr. Mean \pm SD, n=3.	73
3.26	The pH values of nine <i>Lactobacillus</i> species in MRS supplemented with 0.3%w/v oxgall medium in 48 hr. Mean \pm SD, n=3.	74
3.27	The pH values of <i>Lactobacillus</i> species in MRS supplemented with 0.5%w/v oxgal medium in 48 hr. Mean \pm SD, n=3.	75
4.1	Scanning electron micrographs of (A) FTDC 0582, (B) FTDC 0785, (C) FTDC 2916, (D) FTDC 4462 and (E) FTDC 4793.	85
4.2	16S rDNA PCR amplification of five lactobacilli species. Gel (*): Ladder standard marker with 100 bp molecular weight; Gel A: FTDC 0582; Gel B: FTDC 0785; Gel C: FTDC 2916; Gel D: FTDC 4462 and Gel E: FTDC 4793.	89
4.3	Phylogenetic tree based on 5 specimens from 3 <i>Lactobacillus</i> sp. based on the sequence of the 16S rDNA gene using Neighbor-Joining tree.	91

4.4	Phylogenetic tree position of five lactobacilli species with other species. The members of bacteria used based on 11 <i>Lactobacillus</i> species based on the sequence of the 16S rDNA gene using Neighbor-Joining tree. Other than FTDC 0582, FTDC 0785, FTDC 2916, FTDC 4462 and FTDC 4793, all sequences were downloaded from GenBank. The software package MEGA 5.2 was used for analysis.	94
5.1	Effect of cultivation temperature on the viable count of <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i> . Mean \pm SD, n=3.	108
5.2	Effect of initial medium pH on the viable count of <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i> . Mean \pm SD, n=3.	111
5.3	Effect of inoculum size on the viable count of <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i> . Mean \pm SD, n=3.	114
5.4	Effect of agitation rate on the viable count of <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i> . Mean \pm SD, n=3.	117
5.5	Mean pH values of six agro-waste substrates with <i>L. brevis</i> over cultivation time of 36 hr. Mean \pm SD, n = 3.	122
5.6	Mean pH values of six agro-waste substrates with <i>L. plantarum</i> over cultivation time of 36 hr. Mean \pm SD, n = 3.	123
5.7	Mean pH values of six agro-waste substrates with <i>L. casei</i> over cultivation time of 36 hr. Mean \pm SD, n = 3.	124
5.8	Titrateable acidity (%) of six agro-waste substrates with <i>L. brevis</i> over cultivation time of 36 hr. Mean \pm SD, n = 3.	127
5.9	Titrateable acidity (%) of six agro-waste substrates with <i>L. plantarum</i> over cultivation time of 36 hr. Mean \pm SD, n = 3.	128
5.10	Titrateable acidity (%) of six agro-waste substrates with <i>L. casei</i> over cultivation time of 36 hr. Mean \pm SD, n = 3.	129
5.11	The biomass of <i>L. brevis</i> cultivated in six agro-waste substrates over cultivation time of 36 hr. Mean \pm SD, n = 3.	132
5.12	The biomass of <i>L. plantarum</i> cultivated in six agro-waste substrates over cultivation time of 36 hr. Mean \pm SD, n = 3.	133
5.13	The biomass of <i>L. casei</i> cultivated in six agro-waste substrates over cultivation time of 36 hr. Mean \pm SD, n = 3.	134
5.14	The viable count of <i>L. brevis</i> cultivated in six agro-waste substrates over cultivation time of 36 hr. Mean \pm SD, n = 3.	137
5.15	The viable count of <i>L. plantarum</i> cultivated in six agro-waste substrates over cultivation time of 36 hr. Mean \pm SD, n = 3.	138

5.16	The viable count of <i>L. casei</i> cultivated in six agro-waste substrates over cultivation time of 36 hr. Mean \pm SD, n = 3.	139
5.17	The inhibition zone diameter of extracellular and intracellular fluids of <i>Lactobacillus</i> sp. cultured in six agro-waste substrates against <i>S. aureus</i> . A) <i>L. brevis</i> , B) <i>L. plantarum</i> and C) <i>L. casei</i> . Mean \pm SD, n=3.	142
5.18	The inhibition zone diameter results of extracellular and intracellular fluids of <i>Lactobacillus</i> sp. cultured in six agro-waste substrates against <i>E. coli</i> . A) <i>L. brevis</i> , B) <i>L. plantarum</i> and C) <i>L. casei</i> . Mean \pm SD, n=3.	143
6.1	The multi-wave 3000 microwave equipment.	156
6.2	Atomic absorption spectrophotometer (Shimadzu AA7000).	157
6.3	Mean standard calibration curve of BSA protein. Mean \pm SD, n = 3.	161
6.4	Concentration of protein and reducing sugar and non reducing sugar in pineapple skin. Mean \pm SD, n = 3.	162
6.5	Mean standard calibration curve of glucose. Mean \pm SD, n = 3.	163
6.6(a)	Mean standard calibration curves of chromium (Cr), calcium (Ca), copper (Cu), manganese (Mn), magnesium (Mg) and sodium (Na). Mean \pm SD, n=3.	164
6.6(b)	Mean standard calibration curves of selenium (Se), potassium (K), iron (Fe), zinc (Zn) and aluminium (Al). Mean \pm SD, n=3.	165
6.7	Effect of different carbon sources on the viable count of <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i> . Mean \pm SD, n=3.	169
6.8	Effect of glucose concentrations on the viable count of <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i> . Mean \pm SD, n=3.	171
6.9	Effect of different nitrogen sources on the viable count of <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i> . Mean \pm SD, n=3.	174
6.10	Effect of yeast extract, skim milk, beef extract, peptone and the combination (YSBP) at 1:1:1:1 ratio on the viable count of <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i> . Mean \pm SD, n=3.	177
6.11	Effect of YSBP concentration on the viable count of <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i> . Mean \pm SD, n=3.	180
6.12	Effect of dipotassium hydrogen phosphate concentration on the viable count of <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i> . Mean \pm SD, n=3.	183
6.13	Effect of sodium acetate concentration on the viable count of <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i> . Mean \pm SD, n=3.	185

6.14	Effect of triammonium citrate concentration on the viable count of <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i> . Mean \pm SD, n=3.	188
6.15	Effect of Tween 80 concentration on the viable count of <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i> . Mean \pm SD, n=3.	191
6.16	Effect of magnesium sulphate concentration on the viable count of <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i> . Mean \pm SD, n=3.	194
6.17	Effect of manganese sulphate concentration on the viable count of <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i> . Mean \pm SD, n=3.	197
6.18	Mean growth profiles of the three <i>Lactobacillus</i> sp. in newly developed pineapple skin medium and MRS. A) <i>L. brevis</i> , B) <i>L. plantarum</i> and C) <i>L. casei</i> . Mean \pm SD, n=3.	201
7.1	Mean standard calibration curve of lactic acid. Mean \pm SD, n = 6.	223
7.2	Chromatogram of lactic acid standard solution at 20 mg/mL.	225
7.3	The HPLC chromatogram of lactic acid of samples. (A) <i>L. brevis</i> , (B) <i>L. plantarum</i> and (C) <i>L. casei</i> .	227
7.4	Mean standard calibration curve of diacetyl. Mean \pm SD, n = 3.	229
7.5	Diacetyl concentrations produced by <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i> . Mean \pm SD, n = 3.	230
7.6	Mean standard calibration curve of H ₂ O ₂ . Mean \pm SD, n = 3.	231
7.7	The H ₂ O ₂ concentrations produced by <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i> . Mean \pm SD, n = 3.	231
7.8	Mean standard calibration curve of lipid. Mean \pm SD, n = 3.	232
7.9	Lipid concentration in extracellular fluid of <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i> . Mean \pm SD, n = 3.	233
7.10	Mean standard calibration curve of glucose. Mean \pm SD, n = 3.	234
7.11	EPS concentration in extracellular fluid of <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i> . Mean \pm SD, n = 3.	234
7.12	Mean standard calibration curve of BSA. Mean \pm SD, n = 3.	235
7.13	Ammonium sulfate concentration for protein of extracellular fluid of <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i> . Mean \pm SD, n = 3.	236
7.14	Protein concentrations in extracellular fluid of <i>L. brevis</i> , <i>L. plantarum</i> and <i>L. casei</i> . Mean \pm SD, n = 3.	237

7.15	SDS-PAGE of protein sample showing three main bands. Ladder: Protein molecular weights (kDa) of prestained SDS-PAGE standards # 1610318; Lane I: Protein of <i>L. casei</i> ; Lane II: Negative control (newly developed pineapple skin medium only); Lane III: Protein of <i>L. casei</i> .	239
7.16	PEAKS database with matching protein confidence score and protein sequence coverage of ubiquitin.	243
7.17	Crystal structure of ubiquitin from Protein Data Bank.	244
7.18	Peaks database with matching protein confidence score and protein sequence coverage of casein.	244
7.19	Proposed antimicrobial mechanism of positively charged peptides.	245
8.1	Phylogenetic tree based on (25 specimens) Neighbour-Joining analysis on sequence of the 16S rDNA gene, other than <i>S. typhimurium</i> , <i>P. aeruginosa</i> , <i>E. coli</i> , <i>K. pneumoniae</i> and <i>S. aureus</i> . All sequences were downloaded from the GenBank.	254
8.2	Mean inhibition zone diameter value of extracellular fluid from <i>L. casei</i> against pathogenic microorganisms. Mean \pm SD, n = 3.	255
8.3	Mean inhibition zone diameter values of pathogenic microorganism produced by lactic acid and protein bioactive metabolites from <i>L. casei</i> . Mean \pm SD, n = 3.	257
8.4	Antimicrobial mechanism of lactic acid (www.thepoultrysite.com).	258
8.5	Antimicrobial mechanism of bioactive protein (www.degruyter.com).	258
8.6	Mean growth inhibition curve of various bacteria and yeast. Mean \pm SD, n=3.	260

LIST OF EQUATIONS

	Page
5.1 The percentage of water content	98
5.2 The percentage of nitrogen in sample	99
5.3 The percentage of crude protein	99
5.4 The percentage of crude fat	100
5.5 The percentage of crude fiber	101
5.6 The percentage of ash	101
5.7 The percentage of nitrogen-free extract	101
5.8 The percentage of titrable acidity	105
6.1 Concentration of non reducing sugar	155
7.1 The percentage of coefficient of variation	208
7.2 The percentage of bias	208
8.1 The percentage of growth reduction	251

LIST OF ABBREVIATION & SYMBOLS

Abbreviation	Full description
ACN	Acetonitrile
Al	Aluminium
AOAC	Association of Official Analytical Chemists
API	Analytical profile index
APS	Ammonium persulfate
ATP	Adenosine triphosphate
BaCl ₂	Barium chloride
BLAD	Bovine leukocyte adhesion deficiency
BLAST	Basic local alignment search tool
BOD	Biological oxygen demand
bp	Base pair
BSA	Bovine serum albumin
BV	Bacterial vaginosis
C ₄ H ₈ O ₂	Acetyl methyl carbinol
Ca	Calcium
CaSO ₄	Calcium sulphate
CFU	Colony forming units
CH ₄ N ₂ O	Urea
CLA	Conjugated linoleic acid
CO ₂	Carbon dioxide
COD	Chemical oxygen demand
Cr	Chromium
Cu	Copper
CuSO ₄ .5H ₂ O	Copper sulphate penta-hydrate
CV	Coefficient of variation
DMSO	Dimethyl sulfoxide
DNA	Deoxyribonucleic acid
DTT	Dithiothreitol
DUMPS	Deficiency of uridine monophosphate synthase
<i>E. coli</i>	<i>Escherichia coli</i>
e.g	For example
EDTA	Ethylene diamine tetraacetic acid
EEA	European Environmental Agency
EPS	Exopolysaccharides
<i>et al.</i>	et alia (and others)
FDA	Food and drug administration
FDP	Fructose-1-6-diphosphate
Fe	Iron
Fig.	Figure
FTDC	Food Technology Division Culture
g	Gram
GIT	Gastrointestinal tract
GRAS	Generally Recognized As Safe
H ₂ O	Water
H ₂ O ₂	Hydrogen peroxide
H ₂ SO ₄	Sulphuric acid

H ₃ PO ₄	Phosphoric acid
HCD	High energy collision dissociation
HCl	Hydrochloric acid
HMDS	Hexamethyldisilazane
HNO ₃	Nitric acid
HPLC	High performance liquid chromatography
hr	Hour
i.e.	That is
IC ₅₀	The half maximal inhibitory concentration (IC ₅₀) is a measure of the effectiveness of a substance in inhibiting a specific biological or biochemical function.
ICR	Ion cyclotron resonance
IMViC	Indole production, methyl red, Voges-Proskauer and citrate reaction (i inserted for euphony)
K	Potassium
K ₂ HPO ₄	Dipotassium hydrogen phosphate
kDa	Kilo dalton
LAB	Lactic acid bacteria
LAS	Luminescent image analyzer
LC-MS	Liquid chromatography tandem mass spectrometry
MBC	Minimum bactericidal concentration
MEGA	Molecular Evolutionary Genetics Analysis
MFC	Minimal fungicidal concentration
mg	Milligram
Mg	Magnesium
MgSO ₄	Magnesium sulfate
MIC	Minimum inhibitory concentration
min	Minute
mL	Milliliter
Mm	Millimeter
mM	Millimolar
Mn	Manganese
MnSO ₄	Manganese sulfate
MRS	Man Rogosa Sharpe
MRVP	Methyl-red and Voges-Proskauer
MS	Mass spectrometry
Na	Sodium
Na ₂ CO ₃	Sodium carbonate
NaCl	Sodium chloride
NaNO ₃	Sodium nitrate
NaOH	Sodium hydroxide
NCBI	National Center for Biotechnology Information
NFE	Nitrogen free extract
NH ₄ Cl	Ammonium chloride
NH ₄ HCO ₃	Ammonium biocarbonate
O ₂	Oxygen
OD	Opaque density
<i>P</i>	<i>P</i> -value
PCR	Polymerase chain reaction
PDB	Protein Data Bank

pH	Potential hydrogen
ppm	Parts per million
QC	Quality control
QRc	Quality reagent chemical
QTOF	Quadrupole time-of-flight mass spectrometer
rDNA	Ribosomal deoxyribonucleic acid
RNA	Ribonucleic acid
RPM	Round per minute
rpm	Revolutions per minute
SD	Standard deviation
SDS	Sodium dodecyl sulfate
SDS - PAGE	Sodium dodecyl sulfate-poly acrylamide gel electrophoresis
Se	Selenium
sec	Second
SEM	Scanning electron microscopy
SPV	Sulfo-phospho-vanillin
subsp.	Subspecies
TAE	Tris-acetate-EDTA
TEMED	Tetramethylethylenediamine
TFA	Trifluoroacetic acid
TTC	Triphenyltetrazolium chloride
USDA	United States Department of Agriculture
v/v	Volume by volume
VP	Voges-Proskauer
w/v	Weight by volume
WHO	World Health Organization
Zn	Zinc
βME	β-mercaptoethanol
μL	Microliter
μm	Micrometer
%	Percent
°C	Degree centigrade

LIST OF APPENDICES

- 3.1 Gram stain reagents
- 3.2 Man-Rogosa–Sharpe (MRS) broth
- 3.3 Motility test agar
- 3.4 MRVP broth
- 3.5 Tryptone broth
- 3.6 Simmons citrate agar
- 3.7 Phenol red broth base
- 3.8 Voges-Proskauer reagents
- 3.9 Viable count and pH value of twenty lactobacilli species over cultivation time of 36 hr. Mean \pm SD.
- 4.1 Composition of the API 50 CH strip
- 4.2 Results of FTDC 0582 from API-*web*TM software database
- 4.3 Nucleotide sequence chromatogram of 16S rDNA gene of FTDC 0582
- 4.4 The nucleotide sequences derived from 16S rDNA of five *Lactobacillus* species
- 6.1 Instrument parameters for trace elements determination
- 6.2 Constituents of three main pineapple skin waste
- 6.3 Composition of newly developed selective pineapple skin medium
- 6.4 Cost of MRS medium
- 6.5 Costs of ingredients from chemical store, USM.
- 7.1 Tris-HCl buffer solution 1.5 M (pH 8.8)
- 7.2 Tris-HCl 0.5 M (pH-6.8)
- 7.3 2x Laemmli sample buffer
- 7.4 SDS running buffer
- 7.5 Bradford reagent

**PENSKRINAN SISA PERTANIAN SEBAGAI SUBSTRAK PERTUMBUHAN,
KUANTIFIKASI DAN AKTIVITI ANTIMIKROB METABOLIT BIOAKTIF
SPESIS *LACTOBACILLUS***

ABSTRAK

Tujuan kajian ini adalah untuk menskrin dan kenalpasti sisa pertanian yang sesuai dalam membangunkan media pertumbuhan yang selektif untuk *Lactobacillus*. Metabolit bioaktif yang dihasilkan oleh *Lactobacillus* dikira dan aktiviti antimikrob ditentukan. Sebelum permulaan kajian, identiti dua puluh bakteria probiotik yang dibekalkan oleh Pusat Pengajian Teknologi Industri, USM, telah disahkan sebagai *Lactobacillus* melalui ujian morfologi dan biokimia. Daripada dua puluh kultur bakteria, sembilan kultur yang menunjukkan bilangan pertumbuhan melebihi 9.0 log₁₀ CFU/mL telah dipilih untuk ujian toleransi asid dan hempedu. Lima kultur bakteria yang menunjukkan bilangan pertumbuhan melebihi 9.0 log₁₀ CFU/mL dalam media asidik dengan pH 1.5 dan mengurangkan pH media dengan 0.5%w/v garam hempedu kurang daripada 4.5, telah dikenalpasti dengan kaedah SEM, API 50 CHL and 16S rDNA. Identiti *Lactobacillus* telah disahkan sebagai *L. brevis*, *L. plantarum* dan *L. casei*. Nilai nutrisi enam sisa pertanian yang senang diperolehi, murah dan banyak, iaitu kulit tembikai susu, jambu, mangga, kubis, nenas dan betik, ditentukan melalui analisis proksimat dan diskrim sebagai substrak pertumbuhan. Ketiga-tiga *Lactobacillus* tumbuh dalam semua enam sisa pertanian. Bendalir ekstraselular menunjukkan aktiviti antimikrob yang lebih tinggi secara signifikan daripada bendalir intraselular untuk ketiga-tiga spesis *Lactobacillus* yang dikultur dalam kesemua enam substrak sisa pertanian. Bilangan pertumbuhan lactobacilli paling tinggi apabila dikultur dalam kulit nenas. Pengaruh nutrien substrak, glukosa, YSBP, K₂HPO₄, natrium asetat, triammonium sitrat, Tween 80, magnesium sulfat dan manganese sulfat atas pertumbuhan *L. brevis*, *L. plantarum* dan *L. casei* dinilai.

Pertumbuhan optimum dicapai dengan 1.0%b/v glukosa, 1.0%b/v YSBP, 0.1%b/v K_2HPO_4 , 0.1%b/v natrium asetat, 0.2%b/v ammonium sitrat, 0.075%b/v Tween 80, 0.20%b/v magnesium sulfat dan 0.005%b/v manganese sulfat. Medium yang baru dan selektif telah dibangun dengan kulit nenas sebagai platform dikayakan dengan nutrien penting. Bilangan pertumbuhan *L. brevis*, *L. plantarum* dan *L. casei* yang dikultur dalam media kulit nenas baru yang lebih murah dan selektif adalah setara dengan media MRS. Metabolit-metabolit bioaktif bendalir ekstraselular *L. brevis*, *L. plantarum* dan *L. casei*, yang merangkumi asid laktik, lipid, diasetil, eksopolisakarida, hidrogen peroksida dan protein ditentukan. Kandungan asid laktik didapati paling tinggi diikuti dengan protein. Protein bioaktif dalam bendalir ekstraselular *Lactobacillus casei* dipilih untuk identifikasi dengan LC-MS/MS Orbitrap. Ubiquitin dan kasein didapati protein utama dalam bendalir ekstraselular *Lactobacillus casei*. Aktiviti antimikrob bendalir ekstraselular, asid laktik dan protein bioaktif terhadap *S. typhimurium*, *P. aeruginosa*, *E. coli*, *K. pneumonia*, *S. aureus* dan *C. albicans* ditentukan dengan membandingkan zon perencatan. Protein bioaktif (bakteriosin) menunjukkan aktiviti antimikrob yang lebih tinggi daripada asid laktik. IC_{50} , MIC and MBC bakteriosin adalah standing dengan erythromycin untuk *S. typhimurium*, *P. aeruginosa*, *K. pneumonia* dan *S. aureus*. Protein bioaktif (bakteriosin) lebih berkesan daripada erythromycin terhadap *E. coli*, tetapi kurang berkesan daripada clotrimazole terhadap *C. albicans*. Secara kesimpulan, suatu media kulit nenas yang murah dan selektif yang boleh digunakan untuk laktobasili telah berjaya dibangun. Penggunaan sisa pertanian sebagai media pertumbuhan boleh mengurangkan pengumpulan sisa dan pencemaran alam. Di samping itu, protein bioaktif (bakteriosin) boleh dijadikan sumber yang berpotensi untuk penemuan agen antimikrob yang baru.

SCREENING OF AGRO-WASTES AS GROWTH SUBSTRATE, QUANTIFICATION AND ANTIMICROBIAL ACTIVITY OF BIOACTIVE METABOLITES OF *LACTOBACILLUS* SPECIES

ABSTRACT

The objective of this study was to screen and identify a suitable agro-waste in the development of a selective growth medium for *Lactobacillus*. The bioactive metabolites produced by *Lactobacillus* were quantified and the antimicrobial activity determined. Prior to the commencement of study, the identity of twenty probiotic bacteria provided by School of Industrial Technology, USM, was confirmed as *Lactobacillus* using morphological and biochemical studies. From the twenty bacteria cultures, nine that exhibited viable count of above $9.0 \log_{10}$ CFU/mL were selected for acid and bile tolerance tests. Five bacteria culture that exhibited viable counts of more than $9.0 \log_{10}$ CFU/mL in acidic medium of pH 1.5 and in a medium with 0.5% w/v bile salt at pH less than 4.5, were identified using SEM, API 50 CHL and 16S rDNA methods. The identity of the lactobacilli was confirmed to be *L. brevis*, *L. plantarum* and *L. casei*. The nutritional values of six easily available, economical, and abundant agro-wastes, namely honeydew skin, guava skin, mango skin, cabbage leave, pineapple skin and papaya skin, were determined through proximate analysis and screened as growth substrate. All the three lactobacilli grew in the six agro-wastes. The extracellular fluid (cell-free fluid) demonstrated a significantly higher antimicrobial activity than intracellular fluid (lysate fluid) for the three *Lactobacillus* species cultured in all the six agro-waste substrates. The viable count of lactobacilli was the highest when cultured in pineapple skin. The influence of substrate nutrients, glucose, YSBP (combination of yeast extract, skim milk, beef extract and pepton at ratio 1:1:1:1), dipotassium hydrogen phosphate, sodium acetate, triammonium citrate, Tween 80, magnesium sulphate and manganese sulphate on the growth of *L. brevis*,

L. plantarum and *L. casei* was evaluated. The optimum growth was achieved with 1.0%w/v glucose, 1.0%w/v YSBP, 0.1%w/v K₂HPO₄, 0.1%w/v sodium acetate, 0.2%w/v triammonium citrate, 0.075%w/v Tween 80, 0.20%w/v MgSO₄ and 0.005%w/v MnSO₄. A new and selective medium was developed using pineapple skin as platform enriched with the essential nutrients. The viable count of *L. brevis*, *L. plantarum* and *L. casei* cultured in the newly developed more economical selective pineapple skin medium was comparable with Man-Rogosa–Sharpe (MRS) medium. The bioactive metabolites of extracellular fluid of *L. brevis*, *L. plantarum* and *L. casei*, which included lactic acid, lipid, diacetyl, exopolysaccharide, hydrogen peroxide and protein, were quantified. It was found that the content of lactic acid was the highest followed by protein. The bioactive protein in the extracellular fluid of *Lactobacillus casei* was selected for identification using LC-MS/MS Orbitrap. Ubiquitin and casein were found to be the major proteins in the extracellular fluid of *Lactobacillus casei*. The antimicrobial activity of extracellular fluid, lactic acid and bioactive protein against *S. typhimurium*, *P. aeruginosa*, *E. coli*, *K. pneumonia*, *S. aureus* and *C. albicans* was determined by comparing the zone of inhibition. The bioactive protein (bacteriocin) showed comparatively higher antimicrobial activity than lactic acid. The IC₅₀, MIC and MBC of bacteriocin were closely comparable to erythromycin for *S. typhimurium*, *P. aeruginosa*, *K. pneumonia* and *S. aureus*. The bioactive protein (bacteriocin) was more effective than erythromycin against *E. coli*, but less effective than clotrimazole against *C. albicans*. In conclusion, a selective and economical pineapple skin medium for lactobacilli was successfully developed. The use of agro-waste as growth medium could reduce waste accumulation and environmental pollution. Furthermore, the bioactive protein (bacteriocin) could be potential source for the discovery of novel antimicrobial agents.

CHAPTER 1

INTRODUCTION

1.1 Overview

Agro-waste substrates can be defined as any unwanted residues from industrial agriculture. Agro-waste substrates can be classified into two categories, fruit or plant residues and animal manures. On the other hand, the examples of plant residues are peels, cores, leaves, roots, hulls and plant fibers (Kuan and Liong, 2008). The examples of animal manures are dumps, shells, feathers, scales, intestines, furs, hair and bones. The agro-waste is often treated as useless and discarded (Harris *et al.*, 2001). There are 140 billion metric tons of wastes generated every year globally from agriculture (Rahman, 2013). It was reported that the figure would double in the next decade (Brennan-Tonetta *et al.*, 2014). As such, there is a serious waste disposal problem, which can lead to environmental pollution.

The concept of probiotics was introduced by Metchnikoff (1907). The term "probiotics" was coined by Lilly and Stillwell (1965) to describe substances produced by microorganisms that stimulate the growth of another. The word "substances" in Parker's definition of probiotics resulted in a wide connotation that included antibiotics (Preidis and Versalovic, 2009).

The most widely used bacterial probiotics include species of the following genera: *Lactobacillus*, *Bifidobacterium*, *Propioni-bacterium*, *Enterococcus*, *Streptococcus*, *Pediococcus*, *Lactococcus*, *Bacillus* and *Leuconostoc* (Fuller, 2012). *Lactobacillus* and *Bifidobacterium* are two major groups of microorganisms which are well known

for their probiotic properties (Elghandour *et al.*, 2014; Fijan, 2014). Probiotics also include yeasts such as *Saccharomyces cerevisiae* (González Pereyra *et al.*, 2014).

Lactobacillus is one of the most commonly used probiotics because it is considered as the most beneficial microorganism. The concepts of probiotics and health promoting benefits of consumption of lactobacilli have been known for several years. The ideal characteristics of probiotics are non-pathogenic, non-toxic, maintaining good and valuable effect on the host, adhering to cells, reducing pathogenic adherence, presenting as viable cells in large numbers, stable and capable to remain viable under storage conditions, surviving in the gut environment and safe (Saarela *et al.*, 2000; Walton and Gibson, 2010; Ortiz *et al.*, 2014). In addition, probiotics produce antimicrobial agents such as organic acids, hydrogen peroxide and bacteriocins which are antagonistic to pathogenic microorganisms (Larsen *et al.*, 1993; Shokryazdan *et al.*, 2014).

1.2 Problem statement

Teh *et al.* (2010) reported that Malaysia produced approximately 0.20 million tones of fruits annually. However, only 20% of the whole fruit is edible, while the skin, core, base and rind are discarded as wastes. Nevertheless, these fruit wastes have been reported to contain sugar and can be used as growth substrate for microbial growth. Hills and Roberts (1982) reported that honeydew peel contains primary sugar. Guava peel has ash, lipid, protein, carbohydrate and fibre (Conway, 2002; Owen *et al.*, 2008; Ogoloma *et al.*, 2013). The mango peel contains protein, lipid, mineral and fibres (Gopalan *et al.*, 1999). The pineapple skin contains protein, lipid, carbohydrate, fiber, ash, calcium, magnesium, phosphorus, iron, sodium and

potassium (Sasaki *et al.*, 2012; Ezejiofor *et al.*, 2014). Papaya peel contains protein and carbohydrate (Kumar *et al.*, 1989; Asibey-Berko and Tayie, 2004). The accumulation of these agro-wastes could cause environmental pollution. On the other hand, the use of fruit wastes as growth substrate not only offers an environmental-friendly solution to the organic waste problem but also a way of turning waste into wealth. In addition, the use of a more economical growth substrate can reduce the cost of probiotics production. Fermentation medium cost alone constitutes around 50% of the total cost of lactobacilli production (Hofvendahl and Hahn-Hägerdal, 2000), making the probiotics easily accessible. There has been no comprehensive study to screen and compare the agro-wastes as suitable fermentation medium for *Lactobacillus*. The selected agro-waste can then be compared with commercial medium in terms of viable count.

The extracellular fluid of *Lactobacillus* has been reported to contain bioactive metabolites. The bioactive metabolites have been identified as organic acids (Collado *et al.*, 2013), hydrogen peroxide (Lau and Liong, 2014), diacetyl (Ouwehand and Vesterlund, 2011), fatty acids (O'Shea *et al.*, 2012) and proteins (Sánchez *et al.*, 2010). The composition of bioactive compounds of extracellular fluid is highly dependent on the type of fermentation medium. The antimicrobial activity of the extracellular fluid is believed to be attributed to these bioactive compounds. There has been no comprehensive study to evaluate the antimicrobial activity and quantify the content of the individual bioactive compounds of the extracellular fluid produced from *Lactobacillus* cultured in agro-waste medium.

1.3 Experimental work and scope of the study

The aim of the present study was to screen six abundantly and easily available agro-wastes, namely, honeydew skin, guava skin, mango skin, cabbage leave, pineapple skin and papaya skin as suitable fermentation medium for *Lactobacillus*. Experiments were carried out to quantify and evaluate the antimicrobial activity of bioactive metabolites of *Lactobacillus* species. The types of bioactive protein were identified.

The experimental work was divided into various stages which encompassed the following objectives:

1. To confirm the identity of twenty lactobacilli species as potential probiotics culture through morphological and biochemical tests. *Lactobacillus* species with viable count above $9.0 \log_{10}$ CFU/mL was selected for acid and bile salt tolerance tests.
2. To identify the species of lactobacilli with viable count of more than $9.0 \log_{10}$ CFU/mL in acidic condition, and pH 4.5 or lower in bile salts, using scanning electron microscopy, biochemical profile (API 50 CHL identification kit) and molecular 16S rDNA genotypic method.
3. To determine the nutritional values of six agro-waste substrates (honeydew skin, guava skin, mango skin, cabbage leave, pineapple skin and papaya skin) and investigate the antimicrobial activity of the intracellular and extracellular fluids of *Lactobacillus* species cultivated in the six agro-waste substrates against *Staphylococcus aureus* and *Escherichia coli*.

4. To evaluate the effect of nutrients on the growth of selected *Lactobacillus* species cultured in an optimum agro-waste. The content of minerals, protein and sugars of the optimum agro-waste was quantified. A new and selective growth medium was developed using the agro-waste as platform enriched with essential nutrients. The newly developed agro-waste medium was compared with a commercial culture medium (MRS) in terms of viable count of *Lactobacillus*.
5. To quantify the bioactive metabolites of the selected *Lactobacillus* species cultured in the newly developed selective agro-waste medium and to identify the bioactive protein using LC-MS/MS Orbitrap.
6. To study the antimicrobial activity of bioactive metabolites against pathogenic bacteria and yeast.

CHAPTER 2

LITERATURE REVIEW

2.1 Agricultural wastes

According to European Environmental Agency (EEA), agricultural waste is one of the five major waste streams in Europe. The accumulation of agro-waste can cause health, safety, environmental, and esthetic concern. According to Subba (1993) and Caprara *et al.* (2011), agro-wastes contain insoluble chemical constituents (e.g., cellulose and lignin) and soluble constituents (e.g., sugar, amino acids, and organic acids). Other constituents are fats, oil waxes, resins, pigment, protein, and minerals (Lim and Matu, 2014).

Waste is an inevitable by-product that arises from various anthropogenic activities. It is also considered as one of the major sources of environmental degradation since it causes air, land and water pollution and contributes to global warming (Peter, 2010). Hence, proper waste management options are vitally important based on the types of wastes and cost effective factors to further reduce environmental degradation and ecosystem destruction.

Leiva-Candia *et al.* (2014) reported the potential use of waste from the agricultural sector for the production of biodiesel through the culture of yeast. One of the outlets for re-using agricultural wastes and/or by-products is in animal feed production. The use of so-called low value crop wastes might be of particular interest. According to their nutritional composition, volume and pollution risk, some wastes have the potential to be utilized in animal feeds (Ulloa *et al.*, 2004).

2.1.1 Honeydew

Honeydew (*Cucumis melo*) is one of the widely cultivated and consumed vegetable crops in the world. The fruits have significant economic value (Gebhardt *et al.*, 1982). Gebhardt *et al.* (1982) reported that honeydew skin contained 89.66% water, 0.46% crude protein, 0.10% crude lipid and 0.60% total ash. The sugar content is known as an important factor in determining the nutritional quality of honeydew (Danyluk *et al.*, 2014).

2.1.2 Guava

Guava (*Psidium guajava* L) is a tropical fruit with a light yellow or green skin and white, pink or dark-red edible flesh. The shape of the fruit is apple or pear-like. Guava is a good remedy for constipation. It has a mild laxative effect and is good for controlling cholesterol level (Ogoloma *et al.*, 2013). Guava is regarded as one of the effective remedies to lower blood pressure (hypertension), since it normalizes the blood pressure. Guava fruit waste is reported to contain high fibre and lignin content. Guava peel waste has ash, lipid, protein, carbohydrate and fibre, which makes it a suitable medium for microbial growth (Conway, 2002; Owen *et al.*, 2008; Ogoloma *et al.*, 2013).

Devasena *et al.* (2004) mentioned that guava fruit waste had the highest fibre and lignin content. Conway (2002) showed that guava peel contained 77 - 86% water, 2.8 - 5.5% crude fibre, 0.43 - 0.7% total ash and 36 - 50 kcal/100 g energy. Adrian *et al.* (2012) reported that guava peel contained 84.9% water, 0.53% crude lipid, 0.88% crude protein and 13.2% carbohydrates. Ogoloma *et al.* (2013) reported that guava

peel had 76.60 - 79.45% water, 0.91 - 1.29% total ash, 1.60 - 2.05% crude lipid, 2.10 - 2.19% crude protein, 0.97 - 2.61 carbohydrate and 12.90 - 17.40% crude fibre.

2.1.3 Mango

Mango (*Mangifera indica* L.) is one of the most important seasonal and tropical fruits in the world. The world production of mango fruits is more than 35 million ton (Berardini *et al.*, 2005). Mango peels and seed kernels are the major by-products. Kernels take up about 17% - 22% (Kittiphoom, 2012), while peel contributes about 15% - 20% (Gopalan *et al.*, 1999). The peel is normally discarded as a waste and causes pollution. Gopalan *et al.* (1999) reported that the peel contained 81% water, 0.6% crude protein, 0.4% crude lipid, 0.4% minerals and 0.7% crude fibre. Most studies on the exploitation of mango peels have been dealing with their use as a source of pectin, which is considered as a high quality dietary fiber (Pedroza-Islas *et al.*, 1994; Tandon and Garg, 1999). The peel was also reported to be a good source of phyto-chemicals, such as polyphenols, carotenoids that exhibit good antioxidant properties (Kim *et al.*, 2010).

2.1.4 Cabbage

The value of Chinese cabbage (*Brassica oleracea* var. *capitata*) as food and in medicine was known to the ancient Greeks and Romans. Rajadevan and Schramm (1989) reported that cabbage contained 92.7% water, 1.46% crude protein, 0.38% crude lipid, 1.11% total ash, 1.65% crude fibre and 2.7% carbohydrate. The Chinese cabbage contains sufficient nutrients of reducing sugar, protein and phosphorous for yeast culture (Choi *et al.*, 2002; Emebu and Anyika, 2011). Therefore, the large amount of Chinese cabbage waste can be used as substrate for microbial growth.

Emebu and Anyika (2011) showed that cabbage waste contained 81.38% water, 3.00% crude fibre, 0.26% crude lipid, 1.33% total ash, 2.36% carbohydrate and 58.46 kcal/100 g energy.

2.1.5 Pineapple

Pineapple (*Ananas comosus*) waste is comprised basically of the residual pulp, peels, stem and skin, making about 40 - 50% of the fresh fruit (Buckle, 1989; Abdullah, 2007). These materials with high biochemical oxygen demand (BOD) and chemical oxygen demand (COD) values cause serious pollution if not disposed properly (Ban-Koffi and Han, 1990). However, it contains valuable components of carbohydrates and nutrients which are suitable for recycling into valuable product. Pineapple waste is a material which is rich in sugars consisting mainly of sucrose, fructose, glucose and other nutrients (Rani and Nand, 2004). Cordenunsi *et al.* (2010) showed that pineapple skin contained 78.09 - 86.05% water, 0.42 - 0.47% crude protein and 0.22 - 0.53% total ash. It is also reported that pineapple skin contained protein, lipid, total carbohydrate, fiber, ash, calcium, magnesium, phosphorus, iron, sodium and potassium (Sasaki *et al.*, 2012; Ezejiofor *et al.*, 2014). Ogoloma *et al.* (2013) showed that the pineapple waste contained 82.2 - 86.3% water, 0.36 - 0.76% total ash, 2.0 - 3.50% crude lipid, 0.44 - 0.88% crude protein, 2.0 - 2.25% crude fibre and 6.76 - 7.45% carbohydrate. Upadhyay *et al.* (2013) classified pineapple waste as an alternative feed ingredient for animal.

2.1.6 Papaya

Papaya (*Carica papaya* L.) waste was used to feed animals (Kumar *et al.*, 1989). Papaya waste contains protein and carbohydrate (Kumar *et al.*, 1989; Asibey-Berko

and Tayie, 2004). Asibey-Berko and Tayie (2004) reported that papaya waste contained 91.6% water, 10.9% carbohydrate, 0.1% crude lipid, 0.5% crude protein, 0.2% crude fibre, 0.3% total ash and 40.2 kcal/100 g energy. Papaya peels fed to giant West African snails gave the best results in feed intake, weight gain and shell increment with no adverse effects when compared to other tropical fruit by-product (Omole *et al.*, 2004). It is reported that papaya pulp is successfully converted into medium for the preparation of a yogurt-like product using *L. acidophilus* as the fermenting organism (Pakalwad *et al.*, 2010). The bioconversion of papaya peel to alcohol using *Saccharomyces cerevisiae* was reported by Vikash and Sanjay (2012). Ogoloma *et al.* (2013) presented the proximate composition of papaya waste which contained 88.3 - 91.4% water, 0.46 - 0.62% total ash, 0.44 - 0.88% crude protein, 2.47 - 2.93% crude fibre and 2.90 - 6.66% carbohydrate. Lim and Matu (2014) reported the successful use of papaya agro-waste to produce bio-fertilizers.

2.2 Probiotics

The word ‘probiotic’ in greek, means ‘for life’. Probiotics are defined by Fuller (1989) as “a live microbial feed supplement which beneficially affects the host by improving its intestinal microbial balance”. This definition emphasizes the requirement of viability for probiotics and introduces the aspect of a beneficial effect on the host. Havenaar and Huis (1992) elaborated the definition of probiotics with respect to host and habitat of the microflora as “a viable mono-or mixed culture of microorganisms which, when applied to animal or man, beneficially affects the host by improving the properties of the indigenous microflora”. The definition of probiotics was broadened further by Schrezenmeir and de Vrese (2001) who proposed probiotics as “a preparation of a product containing viable, defined

microorganisms in sufficient numbers, which alter the microflora (by implantation or colonization) in a compartment of the host and by that exert beneficial health effects in this host”. World Health Organization (WHO, 2002) defined probiotics as “live microorganisms which when administered in adequate numbers confer a health benefit on the host”.

The common species of probiotics are presented in Table 2.1 (Holzapfel and Schillinger, 2002; Goldin and Gorbach, 2012; Kumar *et al.*, 2012; Thantsha *et al.*, 2012; Svensson and Hakansson, 2014). The safety of *Lactobacillus* sp. and *Bifidobacterium* sp. as probiotics has been extensively reviewed (Borriello *et al.*, 2003; Snyderman, 2008; Svensson and Hakansson, 2014). The characteristics of the common probiotics are shown in Table 2.2.

Table 2.1: Common probiotics species.

<i>Lactobacillus</i> species	<i>Bifidobacterium</i> species	Other species
<i>L. acidophilus</i>	<i>B. bifidum</i>	<i>Bacillus subtilis</i>

	<i>B. dentium</i>	

Table 2.2: Cell morphology, sizes and arrangements of common probiotics.

Genus	Morphology	Size (µm)	Arrangement	References
<i>Lactobacillus</i>	rod-shaped	2.0 - 10.0 (length) 0.5 - 1.20 (width)	single, pairs, chains	Hammes and Vogel (2012) Ray and Bhunia (2013)
<i>Bifidobacterium</i>	short and irregularly rod-shaped	0.8 - 1.5 (length) 0.7 - 1.0 (width)	single or in pairs	Kiviharju <i>et al.</i> (2005)
<i>Bacillus subtilis</i>	rod-shaped	0.87 - 1.41 (length) 0.41 - 0.58 (width)	single or chains	Abusham <i>et al.</i> (2009)
<i>Saccharomyces cerevisiae</i>	cocci or ovoid	2.5-10.0 (length) 1.5 - 5.0 (width)	single or budding	Ellis <i>et al.</i> (2007) Ojokoh and Uzeh (2005)

2.3 Generally Recognized as Safe (GRAS) microorganism

Probiotics are treated as Generally Recognized As Safe (GRAS) microorganism by the Federal Food and Drug Administration (Mattia and Merker, 2008; Snyderman, 2008; Chowdhury *et al.*, 2012). GRAS is a status assigned by the Food and Drug Administration (FDA) to a list of substances not known to be hazardous to health and approved by the FDA for the use in food products. In the Federal Food, Drug and Cosmetic Act, sections 201(s) and 409 Act (Tousley, 1941), GRAS is defined as any substance that is intentionally added to food and is considered as food additives.

The GRAS microorganisms include *Lactobacillus bulgaricus*, *L. fermentum*, *L. lactis*, *L. rhamnosus*, *L. casei* subsp. *rhamnosus* GG, *L. acidophilus*, *L. plantarum*, *L. fermentum*, *L. reuteri*, *L. casei*, *L. acidophilus*, *L. casei* Shirota, *L. johnsonii*, *L. reuteri*, *L. brevis*, *L. salivarius*, *Bifidobacterium lactis*, *Bifidobacterium longum*, *Bifidobacterium animalis* subsp. *lactis*, *B. lactis*, *B. infantis*, *B. animalis*, *B. longum*, *Bacillus coagulans*, *B. subtilis* and *Saccharomyces cerevisiae* (Waite *et al.*, 2001; Mattia and Merker, 2008; Giraffa, 2014; Lau and Liong, 2014).

2.4 *Lactobacillus*

Lactobacillus is one of the members of the eight main genera of lactic acid bacteria (LAB), namely, *Lactobacillus*, *Streptococcus*, *Lactococcus*, *Leuconostoc*, *Bifidobacterium*, *Carnobacterium*, *Enterococcus* and *Sporolactobacillus* (Havenaar and Huis, 1992; Barrangou *et al.*, 2011; Hammes and Vogel, 2012).

2.4.1 Characteristics of *Lactobacillus*

Lactobacillus species are members of the family *Lactobacillaceae* (Felis and Dellaglio, 2007; Felis and Pot, 2014). These bacteria consume sugars as their main source of carbon to produce energy. It produces 85% lactic acid, with less than 15% of other products (De Vos *et al.*, 2009). In addition, *Lactobacillus* sp. also produces enzymes such as proteases and lipases which help to digest proteins, lipid and vitamins (Saguir *et al.*, 2008; Baek and Byong, 2009). Generally, all *Lactobacillus* species are Gram positive, rod-shape, non-motile, non-flagellated and non-spore forming, catalase negative and require complex nutrients for maximal growth (Klein *et al.*, 1998; Corsetti *et al.*, 2005; De Vos *et al.*, 2009; Axelsson, 2011; Khalisanni, 2011). *Lactobacillus* species are able to tolerate bile condition (Hamner *et al.*, 2013; Pato and Surono, 2013), produce hydrogen peroxide and different types of inhibitors such as bacteriocins which have inhibitory actions against various pathogenic microorganisms (Maqsood *et al.*, 2013; Lü *et al.*, 2014). *Lactobacillus* species are fastidious and facultative anaerobic and require slightly acidic condition for optimal growth (Willey *et al.*, 2013). *Lactobacillus* species are able to live in acidic environment with pH range of 4.0 - 5.0 or lower and with an optimum growth between 5.0 and 6.0 (Batt, 2014). At low temperature of 15°C and below, the bacteria do not show any growth. However, *Lactobacillus* can generally survive at temperature up to 40°C with an optimum growth at 35°C (Gomes and Malcata, 1999; Batt, 2014).

2.4.2 Identification of *Lactobacillus*

The identification of *Lactobacillus* depends mainly on physiological and biochemical criteria (Stiles and Holzapfel, 1997; Corsetti *et al.*, 2005; Jafarei and

Ebrahimi, 2011). The prescreening of different *Lactobacillus* sp. was performed using various methods, such as conventional biochemical and physiological tests (Christopher and Bruno, 2003; Hunt *et al.*, 2006; De Vos *et al.*, 2009). It can also be identified by more complex technique such as carbohydrate fermentation patterns using commercially available kits (Molin *et al.*, 1993; Nigatu *et al.*, 2000), or by molecular identification (Christopher and Bruno, 2003; Hunt *et al.*, 2006).

2.4.2.1 Morphological identification

2.4.2.1 (a) Taxonomy

Lactobacillus is the largest genus in lactic acid bacteria group, comprising around 80 recognized species (Saranraj, 2014). The classification of lactobacilli into different species is largely based on their cell morphology, mode of glucose fermentation, growth at different temperature, configuration of the lactic acid produced, ability to grow at high salt concentration, acid or alkaline tolerance, chemotaxonomic markers such as fatty acid composition, constituents of the cell wall, and phylogenetic relationships. A summary of the characteristic of the different *Lactobacillus* species is shown in Table 2.3.

Table 2.3: Characteristic of various *Lactobacillus* species (De Vos *et al.*, 2009).

Species	Characteristics			
	Pantose fermentation	CO ₂ from glucose	CO ₂ from gluconate	FDP aldolase present
<i>L. acidophilus</i>	-	-	-	+
<i>L. casei</i>	+	-	+	+
<i>L. brevis</i>	+	+	+	-
<i>L. delbruckii</i>	-	-	-	+
<i>L. curvatus</i>	+	-	+	+
<i>L. buchneri</i>	+	+	+	-
<i>L. helveticus</i>	-	-	-	+
<i>L. plantarum</i>	+	-	+	+
<i>L. fermentum</i>	+	+	+	-
<i>L. salivarius</i>	-	-	-	+
<i>L. sakei</i>	+	-	+	+
<i>L. reuteri</i>	+	+	+	-

FDP: fructose-1-6-diphosphate.

2.4.2.1 (b) Cell morphology

Cell morphology is important in the current description of the lactobacilli. The bacteria is rod-shaped form and the arrangement is either in single, pairs or chains (Axelsson, 2011; Batt, 2014).

2.4.2.1 (c) Colony morphology

Lactobacilli produce colonies in the range of 0.7 - 2.0 mm diameter (Iemoli *et al.*, 2012). They vary in terms of colour and shape (circular and irregular). The colony morphology may refer to the size, shape, elevation and margin. Colony morphology of lactobacilli species is revealed in Table 2.4.

Table 2.4: Colony morphology of *Lactobacillus* species on specific media.

Medium	Colony Morphology	CD (mm)	CT (hr)	GC	References
MRS agar	cream-white, smooth and convex	1.0 - 2.0	48	FA /35 - 37°C	Iemoli <i>et al.</i> , (2012)
Rogosa agar	white, smooth and convex	1.0 - 2.0	48	FA /35 - 37°C	Rogosa (1970)
GBL agar	brown, round form, rough surface and irregular edge	0.7 - 2.5	48	FA/37°C	Hammes and Vogel (2012)
S-F agar	circular with irregular border, smooth and convex	1.0 - 2.0	48	FA /35 - 37°C	Vogel <i>et al.</i> (1994)
LAMVAB	rod shaped, straight or slightly curved, green colour	1.0 - 1.2	72	FA/37°C	Hartemink <i>et al.</i> (1997)
Homohiochii agar	white smooth, round, convex and slimy	1.5 - 2.0	96	FA/30°C	Henick-Kling and Krieger (2001)

CD: Colony diameter

CT: Cultivation time

GC: Growth condition

FA: Facultative anaerobic

MRS agar: De Man Rogosa Sharpe agar

GBL agar: Glucose blood liver agar

S-F agar: San-francisco agar

LAMVAB: *Lactobacillus* anaerobic MRS with vancomycin and bromocresol green

2.4.2.2 Biochemical characterization

2.4.2.2 (a) Indole test

The indole test tells whether an organism is able to degrade the amino acid tryptophan and produce indole. Prior to the indole test, the medium must be filled with a sufficient quantity of tryptophan (Harley, 2013). A species which grows in a medium rich in tryptophan shows that the species has the capacity to degrade tryptophan (MacFaddin, 2000).

2.4.2.2 (b) Voges-Proskauer test

Voges-Proskauer (VP) test is used to differentiate organisms based on their ability to produce acetylmethylcarbinol (acetoin) from glucose fermentation. VP test is a valuable taxonomic characteristic, useful for differentiating microorganism (Pancheniak and Soccol, 2005).

2.4.2.2 (c) Citrate test

The change in test indicator and drop in pH indicated a species is capable of importing citrate and using it as a sole carbon and energy source. Such species is termed as citrate positive (Woodland, 2009).

2.4.2.2 (d) Carbohydrate fermentation test

Phenol red broth medium is used as a test indicator to check the ability of a given species to ferment the specific carbohydrate, with the production of acid, gas or both (MacFaddin, 2000; Mohan, 2010). It has been used to indicate if the microorganism has utilized the sugars.

2.4.2.2 (e) Analytical profile index (API) kit

Analytical profile index (API) 50 CHL fermentation kit contains many types of carbohydrates and related compounds. The principle of API 50 CHL kit is based on the ability of the microorganisms to ferment 49 different types of carbohydrates which is performed for bacterial species identification (Ertekin and Çon, 2011). It is designed to identify the genus *Lactobacillus* (Coeuret *et al.*, 2003; Dimitonova *et al.*, 2008; Herbel *et al.*, 2013). The carbohydrates are fermented in acids leading to decrease in pH, detected by the change in colour of the indicator. The results make up the biochemical profile which is used by *apiweb*TM identification software with database. In many scientific research studies, this test was used for lactobacilli identification (Nighswonger *et al.*, 1996; Klein *et al.*, 1998; Hedberg *et al.*, 2008).

2.4.2.3 Other conventional tests

2.4.2.3 (a) Gram staining test

Gram staining is a common test to differentiate bacteria by cell wall constituents. This test involves staining of cell with a water soluble dye called crystal violet followed by decolorization and counterstaining. Gram positive bacteria stained deep purple during the decolorization process, as they have a thick outer layer of peptidoglycan. On the other hand, Gram negative bacteria lose the crystal violet stain and are stained pink or red by the safranin in the final staining process, as they have a thin inner layer of peptidoglycan (De Vos *et al.*, 2009; Cappuccino and Sherman, 2013).

2.4.2.3 (b) Spore staining test

The outer coating of spores consists of protein keratin. This keratin coat resists staining. Heating is required to stain the spores. The cells are then decolorized with water and safranin is commonly used as counter stain. As a result, the endospores turn green and the vegetative cells turn red. Schaeffer-Fulton test is the most commonly used staining test (Jones and Versalovic, 2009).

2.4.2.3 (c) Motility test

The ability of bacteria to move is one of the characteristics for classification in microbiology (Christopher and Bruno, 2003). A motile species is easily differentiated from a non-motile species. Motility gelatin medium technique (Kelly and Fulton, 1953) and Hanging-drop wet method (MacFaddin, 2000) can be used to determine the motility.

2.4.2.4 Molecular identification by 16S ribosomal deoxyribonucleic acid (rDNA)

DNA marker is a gene technology tool used for screening chromosome at a known location for identification purpose. It can be described as a variation that can be observed. The common DNA markers include those to determine certain diseases, such as deficiency of uridine monophosphate synthase (DUMPS) and bovine leukocyte adhesion deficiency (BLAD) (Janda and Abbott, 2007). The 16S rDNA is widely used in the molecular identification.

2.4.2.4 (a) Polymerase chain reaction (PCR)

Polymerase chain reaction (PCR) is a revolutionary method developed by Mullis and colleagues in the 1980's. PCR is a process based on using the ability of DNA to

amplify many times to synthesize new strand of DNA complementary to the offered template strand (Dubernet *et al.*, 2002). This process is widely used for detecting and identifying microorganism (Rachman *et al.*, 2003).

Three temperature levels are required in a typical PCR reaction. The first step involves heating to around 94°C. The double stranded DNA is denatured or split into two single strands during this step. The second step involves cooling to approximately 54°C to allow the primers to attach to the single-stranded DNA. The primers determine which section of DNA is copied. They are designed such that they straddle a predetermined specific site on the DNA based on the sequence of the DNA. The third step is performed at around 72°C (Fig. 2.1). The actual copying of the DNA is performed by the DNA polymerase during this step. The DNA polymerase attaches to the primer site and copies DNA using the nucleotides that are in solution as building blocks (Somma and Querci, 2007). The temperature profile of a PCR cycle is controlled by the thermal cycler program which results in a near exponential increase in PCR product accumulation for the first 35 cycles.

Several studies have shown that PCR techniques are far more sensitive, efficient and specific than the morphological technique. PCR method contributes to improvement of the rapid diagnosis and improves the accuracy of the identification of the microorganism (Somma and Querci, 2007; Woo *et al.*, 2008).

Fig. 2.1: The steps of one cycle in the polymerase chain reaction (PCR).

2.4.2.4 (b) Gel electrophoresis

Gel electrophoresis separates substances based on the rate of movement of the analyte under the influence of an electric field. Gel electrophoresis is a powerful tool to analyse nucleic acids and proteins. Agarose is a polysaccharide purified from seaweed. The DNA to be analyzed is forced through the pores of the gel by the electrical current. Under an electrical field, DNA travels from the negative electrode to the positive electrode. Several factors that influence DNA movement in the gel include the strength of the electrical field, the concentration of agarose in the gel and most importantly the size of the DNA molecules. Smaller DNA molecules move through the agarose faster than larger molecules. The different agarose concentrations for separation of different ranges of linear DNA molecules are presented in Table 2.5 (Yılmaz *et al.*, 2012).

Table 2.5: The various agarose concentrations for separation of different ranges of linear DNA molecules.

Agarose concentration in gel (% w/v)	Efficient range of separation of linear DNA molecules (kb)
0.3	5.0 - 60
0.6	1.0 - 20
0.7	0.8 - 10
0.9	0.5 - 7.0
1.2	0.4 - 6.0
1.5	0.2 - 3.0
2.0	0.1 - 1.5

2.4.2.4 (c) Sequencing

Organism's DNA is made up from a large number of nucleotides. The arrangement of nucleotides or bases in each organism is very unique. Therefore, the DNA sequence can be used to differentiate one species from the others. For this reason, DNA sequencing is useful to determine the precise order of nucleotides and identify the organism.

The four well-known techniques of DNA sequencing are, i) Sanger method, ii) Maxam and Gilbert method, iii) pyrosequencing (DNA sequencing in real time) method and iv) single molecule sequencing with exonuclease. RNAs are often sequenced either by converting the RNAs into DNA or by sequencing the DNA gene that gives rise to the RNA (Mitchelson *et al.*, 2007; Tamura *et al.*, 2011).
