

**MACROECONOMIC VARIABLES AND OIL PRICE
SHOCKS IN SUB-SAHARAN AFRICA OIL EXPORTING
COUNTRIES**

by

ABUBAKAR WAMBAI AMINU

**Thesis submitted in fulfillment of the requirements for the
degree of Doctor of Philosophy**

March 2016

DEDICATION

I dedicate this thesis to my late parents Alhaji Muhammad Aminu Sanusi the
Chiroma of Kano and Hajia Mairo Dauda.

ACKNOWLEDGEMENTS

All praise is to Allah, the Almighty, and the Most Exalted. May the peace and blessing of Allah be upon His Holy Prophet Muhammad (S.A.W). I would like to first and foremost express my profound gratitude to my main supervisor Associate Professor (Dr.) Chua Soo Yean for his commitment towards seeing that the thesis possesses the quality of a Ph.D dissertation. Indeed, he has spared his time despite other commitments to make helpful observations, academic contributions based on experience and expertise, incisive comments, proper couching and counseling which enabled me to complete writing the thesis. I also owe a debt of thanks to my co-supervisor (Dr.) Normee Che Sab for her thorough observations, meaningfully constructive criticisms, erudite comments, meticulous editing and helpful academic suggestions which have in no small measure enhanced both the quality and content of the thesis as an academic work. May Allah reward her handsomely amin. I would like to thank Professor Abdul-Ganiyu Garba of the Department of Economics, Ahmadu Bello University, Zaria, for the academic enthusiasm and training he ingrained in me as an academic supervisor during my sojourn as a Masters Degree candidate at the University. Indeed, the academic training I received from him as an academic supervisor is what motivated me to remain in the academics and to pursue a higher degree. I thank Bayero University Kano for providing me with the bursary to complete the program. I express my sincere gratitude to my senior colleagues (Dr.) Umar Bida, (Dr.) Mohammed Aminu Aliyu, (Prof.) Ummu Jalingo, (Dr.) Binta T. Jibril and (Prof.) Badayi M. Sani for their encouragement, academic couching, morale boosting and helpful suggestions. I thank Sheikh Kabir Zango, Mallam Abdul Razaq, Mallam Jibril Umar (Uba), Arafat Abubakar, Naziru Aminu and Muhammad

Isa (Goni) for their fervent prayers. I would also like to thank my friends Ibrahim Suleiman, Mannir Shehu Shayi, Saifullahi Abubakar, (Dr.) Hassan Suleiman, (Dr.) Aminu Garba Waziri, (Dr.) Abdullahi Mohammed Kutigi, (Dr.) Bashir Shodipo, (Dr.) Mershed Pervin, Yusuf Zuntu, Nafi'u Abdullahi Zadawa, Muhammad Jafar Wattoo, and other friends such as Usman Suleiman, Abdul Razaq Dan Waire (Bakon Makkah), Kabiru Hamisu (Kebebe), Khalid Ibn Musa, and Ibrahim Mohammed Dan Tani. Finally, I express my profound gratitude to my beloved brother His Royal Highness the Emir of Kano, Mallam Muhammadu Sanusi (II), for his helpful advice, invaluable suggestions, moral encouragement, and unflinching financial support, which from the beginning to this point helped me tremendously to achieve the feat of completing the program. May Allah reward him richly, amin.

| LIST OF FIGURES | xviii |
| LIST OF ABBREVIATIONS | xxi |
| LIST OF APPENDICES | xxv |
| ABSTRAK | xxvi |
| ABSTRACT | xxix |
| CHAPTER 1: INTRODUCTION | 1 |
| 1.1 Background to the study | 1 |
| 1.2 Oil Prices | 16 |
| 1.3 Exchange Rates | 18 |
| 1.4 The Global Economic and Financial Crisis | 19 |
| 1.5 Problem Statement | 19 |
| 1.6 Objectives of the Study | 20 |
| 1.7 Research Questions | 21 |
| 1.8 Significance of the Study | 21 |
| 1.9 Scope of the Study | 23 |
| 1.10 Organization of Study | 23 |

CHAPTER 2: OVERVIEW OF THE ECONOMIES OF NIGERIA,

| | |
|--|-----------|
| ANGOLA AND GABON | 25 |
| 2.1 Introduction | 25 |
| 2.2 The Economy of Nigeria | 29 |
| 2.2.1 Geography..... | 29 |
| 2.2.2 Demography..... | 29 |
| 2.2.3 Economy | 29 |
| 2.2.4 Macroeconomic Indicators of Nigeria | 31 |
| 2.3 The Economy of Angola | 40 |
| 2.3.1 Geography..... | 40 |
| 2.3.2 Demography..... | 41 |
| 2.3.3 Economy | 41 |
| 2.3.4 Macroeconomic Indicators of Angola | 43 |
| 2.4 The Gabonese Economy | 53 |
| 2.4.1 Geography..... | 53 |
| 2.4.2 Demography..... | 54 |
| 2.4.3 Economy | 54 |
| 2.4.4 Macroeconomic Indicators of Gabon | 56 |
| 2.5 Summary of the Chapter..... | 65 |
| CHAPTER 3: LITERATURE REVIEW..... | 67 |
| 3.1 Introduction | 67 |
| 3.2 Literature Related to Oil Price Volatility | 67 |

| | |
|---|-----|
| 3.2.1 Theoretical Literature Related to Oil Price Volatility | 69 |
| 3.2.2 Empirical Literature Related to Oil Price Volatility | 70 |
| 3.3 Literature Related to Exchange Rate Volatility..... | 73 |
| 3.3.1 Theoretical literature Related to Exchange Rate Volatility | 75 |
| 3.3.2 Empirical Literature Related to Exchange Rate Volatility | 76 |
| 3.4 Literature Related to the Relationship between Oil Prices and Exchange Rates..... | 79 |
| 3.4.1 Theoretical Literature Related to the Relationship between Oil Prices and Exchange Rates | 80 |
| 3.4.2 Empirical Literature Related to the Relationship between Oil Prices and Exchange Rates | 80 |
| 3.5 Literature Related to Oil Price Shocks and the Macro Economy..... | 94 |
| 3.5.1 Theoretical Literature Related to Oil Price Shocks and the Macro Economy | 97 |
| 3.5.2 Empirical Literature Related to Oil Price Shocks and the Macro Economy | 99 |
| 3.6 Literature Related to Oil Price Shocks and Their International Trade Repercussions..... | 106 |
| 3.6.1 Theoretical Literature Related to Oil Price Shocks and Their International Trade Repercussions | 107 |
| 3.6.2 Empirical Literature Related to Oil Price Shocks and Their International Trade Repercussions | 108 |
| 3.7 Literature Related to Exchange Rates and the Macro Economy | 110 |

| | |
|---|------------|
| 3.7.1 Theoretical Literature Related to Exchange Rates and the Macro Economy..... | 110 |
| 3.7.2 Empirical Literature Related to Exchange Rate and the Macro Economy..... | 111 |
| 3.7.3 Exchange Rate and Economic Growth / GDP | 112 |
| 3.7.4 Exchange Rates and Consumption | 113 |
| 3.7.5 Exchange Rates and Investment / Savings | 114 |
| 3.7.6 Exchange Rates and the Price Level / Inflation | 115 |
| 3.7.7 Exchange Rates and Interest Rates | 116 |
| 3.7.8 Exchange rates and the Money Supply | 116 |
| 3.8 Literature Related to Exchange Rates and their International Trade Repercussions | 117 |
| 3.9 Literature Gaps | 118 |
| 3.10 Theoretical Framework | 120 |
| 3.10.1 The Dutch Disease Theory | 121 |
| 3.10.2 The Dutch Disease Model..... | 122 |
| 3.10.3 The Purchasing Power Parity (PPP) Theory | 123 |
| 3.10.4 The Balassa Samuelson Theory / Hypothesis..... | 125 |
| 3.10.5 The Quantity Theory of Money | 126 |
| 3.10.6 The Dornbusch Exchange Rate over shooting Hypothesis..... | 129 |
| 3.10.7 The Real Business Cycle (RBC) Theory | 130 |
| CHAPTER 4: METHODOLOGY | 133 |

| | |
|--|-----|
| 4.0 Introduction | 133 |
| 4.1 Volatility Spillover from Real Oil Prices to the Real Exchange Rates of the Selected Countries | 135 |
| 4.1.1 Unit Root Tests | 135 |
| 4.1.2 ARCH-LM Test | 139 |
| 4.1.3 Multivariate GARCH Models..... | 139 |
| 4.2 The Long run Relationship and Short run Dynamics between the Real Exchange Rates and the Real Oil Prices of the Selected Countries..... | 142 |
| 4.2.1 The Johansen Cointegration Tests | 143 |
| 4.2.2 The Vector Error Correction (VEC) Models | 144 |
| 4.2.3 The Autoregressive Distributed Lag (ARDL) Bounds Test | 145 |
| 4.2.4 The Granger Causality Tests..... | 146 |
| 4.3 Macroeconomic Shocks Transmission from Oil Price and Exchange Rate to Other Macroeconomic variables of the Selected Countries..... | 148 |
| 4.3.1 The Structural Vector Autoregressive (SVAR) Model..... | 148 |
| 4.3.2 Time Series Statistical Diagnostic Tests for Statistical Adequacy | 162 |
| 4.4 Transmission of Macroeconomic Shocks from the Selected Countries to Neighboring Trading Partners | 165 |
| 4.4.1 The Panel Vector Autoregressive (PVAR) Model | 165 |
| 4.4.2 The Panel VAR Model for Nigeria..... | 167 |
| 4.4.3 The Panel VAR Model for Angola | 169 |
| 4.4.4 The Panel VAR Model for Gabon | 170 |

| | |
|---|------------|
| 4.4.5 Statistical Diagnostic Tests for Checking Model Adequacy | 173 |
| 4.5 Data and Description of Variables | 174 |
| 4.5.1 Time Series Data..... | 174 |
| 4.5.2 Panel Data | 177 |
| 4.6 Summary | 178 |
| CHAPTER 5: EMPIRICAL RESULTS AND DISCUSSION | 181 |
| 5.1 Introduction | 181 |
| 5.2 Empirical Results for Nigeria..... | 182 |
| 5.2.1 Volatility Spillover from Real Oil Price to Real Exchange Rate of Nigeria..... | 182 |
| 5.2.2 Testing for Long run Relationship and Short run Dynamics between Real Exchange Rate and Real Oil Price for Nigeria | 190 |
| 5.2.3 Analysis of Macroeconomic Shocks for Nigeria..... | 194 |
| 5.2.4 Analysis of Cross-Country Macroeconomic Shocks Transmission between Nigeria and Her Trading Partners. | 208 |
| 5.3 Empirical Results for Angola | 225 |
| 5.3.1 Volatility Spillover from Real Oil Price to Real Exchange Rate of Angola | 225 |
| 5.3.2 Testing for Long run Relationship and Short run Dynamics between Real Exchange Rate and Real Oil Price for Angola | 233 |
| 5.3.3 Analysis of Macroeconomic Shocks for Angola | 248 |

| | |
|--|-----|
| 5.3.4 Analysis of Cross-Country Macroeconomic Shocks Transmission between Angola and Her Trading Partners | 264 |
| 5.3 Empirical Results for Gabon | 275 |
| 5.3.1 Volatility Spillover from Real Oil Price to Real Exchange Rate of Gabon | 275 |
| 5.4.2 Testing for Long run Relationship and Short run Dynamics between Real Exchange Rate and Real Oil Price for Gabon | 283 |
| 5.4.3 Analysis of Macroeconomic Shocks for Gabon | 286 |
| 5.4.4 Analysis of Cross-Country Macroeconomic Shocks Transmission between Gabon and Her Trading Partners..... | 298 |
| CHAPTER 6: CONCLUSION | 312 |
| 6.0 Introduction | 312 |
| 6.1 Major Findings of the Study..... | 312 |
| 6.2 Economic Policy Implications of Results and Recommendations | 313 |
| 6.3 Limitations of the Study | 318 |
| 6.4 Recommendations for Future Studies | 319 |
| 6.5 Summary | 320 |

**PEMBOLEHUBAH MAKROEKONOMI DAN KEJUTAN HARGA MINYAK
DI NEGARA-NEGARA PENGEKSSPORT MINYAK AFRIKA SUB-
SAHARAN**

ABSTRAK

Kajian ini telah memeriksa pembolehubah-pembolehubah makroekonomi dan kejutan harga minyak di tiga buah negara pengeksport minyak Afrika Sub-Saharan, iaitu Nigeria, Angola dan Gabon. Kajian ini telah menemui bukti limpahan yang tinggi kemudahruapan dari harga minyak benar ke kadar pertukaran benar di Nigeria dan Gabon dan limpahan yang rendah kemudahruapan dari harga minyak benar ke kadar pertukaran benar di Angola. Dalam erti kata lain, korelasi kemudahruapan antara kadar pertukaran benar Nigeria dan Gabon dan harga minyak benar didapati adalah lebih tinggi daripada korelasi kemudahruapan yang didapati antara dua pembolehubah itu untuk Angola. Implikasi dasar ekonomi keputusan-keputusan ini adalah bahawa kadar pertukaran benar Nigeria dan Gabon adalah lebih dipacu oleh kemudahruapan harga minyak daripada kadar pertukaran benar Angola, yang menjadi petanda risiko makroekonomi, mengurangkan perdagangan dan pertumbuhan adalah lebih dalam kedua-dua negara itu daripada Angola. Oleh itu, Nigeria dan Gabon lebih mudah terdedah kepada kesan makroekonomi daripada Dutch disease daripada Angola sebagaimana keputusan GARCH multivariat menunjukkan. Keputusan daripada ujian kointegrasi Johansen mendedahkan tiada bukti hubungan jangka panjang antara kadar pertukaran benar dan harga minyak benar bagi Nigeria dan Gabon, yang menyarankan bahawa dalam jangka masa panjang, tiada bukti penyakit Belanda untuk dua buah negara itu. Dalam kes Angola, ujian ARDL Bounds mendedahkan bukti hubungan jangka panjang yang stabil antara

kadar pertukaran benar dan harga minyak benar, yang mengesyorkan bahawa kesan-kesan makroekonomi penyakit Belanda adalah lebih kukuh dan berpanjangan di Angola daripada di Nigeria dan Gabon. Merujuk kepada dinamik jangka pendek antara kadar pertukaran benar dan harga minyak benar tiga buah negara itu, keputusan ujian sebab akibat Granger mendedahkan bukti sebab akibat dua hala antara kadar pertukaran benar dan harga minyak benar untuk Nigeria, yang menyarankan bahawa harga minyak benar dapat membantu dalam ramalan kadar pertukaran benar dan juga kadar pertukaran benar dapat membantu dalam ramalan harga minyak benar. Dalam kes Gabon, sebab akibat satu hala telah didapati dari kadar pertukaran benar ke harga minyak benar, yang mengesyorkan bahawa kadar pertukaran benar Gabon menyediakan maklumat mengenai pergerakan masa depan harga minyak benar dan harga minyak benar tidak boleh digunakan untuk meramalkan pergerakan masa depan dalam kadar pertukaran benar. Dalam kes Angola, tiada bukti sebab akibat jangka pendek antara dua pembolehubah tersebut. Keputusan kesan dinamik jangka pendek model ARDL menunjukkan bukti hubungan jangka pendek antara kadar pertukaran benar dan harga minyak benar, yang menyarankan bahawa sebab akibat jangka pendek di antara dua pembolehubah itu wujud. Kajian ini telah menemui bukti transmisi kejutan antara pembolehubah-pembolehubah makroekonomi ketiga-tiga negara itu, iaitu harga minyak, kadar pertukaran, bekalan wang, inflasi dan KDNK, dan kadar pertukaran Nigeria telah didapati lebih bertindak balas kepada kejutan harga minyak daripada kadar pertukaran Angola dan Gabon. Kejutan pembolehubah-pembolehubah itu sendiri telah didapati menjadi sumber dominan kejutan-kejutan. Ini menyarankan bahawa kejutan-kejutan adalah dalaman atau domestik. Transmisi kejutan makroekonomi dari tiga buah negara itu ke negara-negara rakan perdagangan jiran telah

diperhatikan, yang menyarankan bahawa rakan dagangan jiran tiga buah negara itu terdedah kepada kejutan makroekonomi luaran yang berasal dari tiga negara itu. Akhir sekali, kajian ini telah mendapati bahawa kejutan krisis ekonomi dan kewangan global 2008 telah memberi kesan kepada pembolehubah –pembolehubah makroekonomi ketiga-tiga negara itu dan juga rakan dagangan mereka. Ini menunjukkan ketiga-tiga negara itu dan rakan perdagangan jiran mereka mudah terdedah kepada ragam kejutan makroekonomi luar.

MACROECONOMIC VARIABLES AND OIL PRICE SHOCKS IN SUB - SAHARAN AFRICA OIL-EXPORTING COUNTRIES

ABSTRACT

The study has examined macroeconomic variables and oil price shocks in three Sub-Saharan African oil-exporting countries, namely Nigeria, Angola and Gabon. The study has found evidence of high volatility spillover from the real oil price to the real exchange rate in Nigeria and Gabon and low spillover of volatility from the real oil price to the real exchange rate in Angola. In other words, the volatility correlations between the real exchange rates of Nigeria and Gabon and the real oil price have been found to be higher than the volatility correlations between the two variables for Angola. The economic policy implication of these results is that the real exchange rates of Nigeria and Gabon are more driven by the volatility of oil price than the real exchange of Angola, which portends the macroeconomic risk of lowering trade and growth more in the two countries than Angola. Hence, Nigeria and Gabon are more susceptible to the macroeconomic effects of the Dutch disease than Angola as the multivariate GARCH results indicate. The results from the Johansen cointegration tests revealed no evidence of long run relationship between the real exchange rate and the real oil price for Nigeria and Gabon, which suggests that in the long run, there is no evidence of the Dutch disease for the two countries. In the case of Angola, the ARDL Bounds test revealed evidence of a stable long run relationship between the real exchange rate and the real oil price, which suggests that the macroeconomic effects of the Dutch disease are more sustained and long lasting in Angola than Nigeria and Gabon. With regards to the short run dynamics between the real exchange rates and real oil prices of the three countries, the results of the

Granger causality tests revealed evidence of bi-directional causality between the real exchange rate and the real oil price for Nigeria, which suggests that the real oil price can help in the prediction of the real exchange rate and also the real exchange rate can help in the prediction of the real oil price. In the case of Gabon, unidirectional causality has been found running from the real exchange rate to the real oil price, which suggests that the real exchange rate of Gabon provides information about the future movements in the real oil price and real oil price cannot be used to predict future movements in the real exchange rate. In the case of Angola, no evidence of short run causality between the two variables has been observed. The results of the short run dynamic effects of the ARDL model indicated evidence of a short run relationship between the real exchange rate and the real oil price, which suggests short run causality between the two variables exists. The study has found evidence of shocks transmission among the macroeconomic variables of the three countries, namely oil price, exchange rate, money supply, inflation and the GDP, and Nigeria's exchange rate has been found to respond more to oil price shock than the exchange rates of Angola and Gabon. The variables' own shocks have been found to be the dominant source of the shocks. This suggests that the shocks are internal or domestic. Transmission of macroeconomic shocks from the three countries onto their neighboring trading partner countries has been observed, which suggests that the neighboring trading partners of the three countries are vulnerable to external macroeconomic shocks that stem from the three countries. Finally, the study has found that the shock of the global economic and financial crisis of 2008 had affected the macroeconomic variables of the three countries as well as those of their trading partners. This indicates the vulnerability of the three countries and their neighboring trading partners to vagaries of external macroeconomic shocks.

CHAPTER 1: INTRODUCTION

1.1 Background to the study

Oil is an indispensable input for production, economic growth and social development. Two-thirds of the global energy requirements are met with oil and gas supplies (African Development Bank and African Union, 2009). Crude oil is among the main sources of energy, and one of the most important and widely traded commodities that affects the global economy and international trade (Milonas and Henker, 2001).¹ It is arguably the most influential physical commodity in the world, because of the significant role it plays in the world economy (Kuncoro, 2011).

Africa is among the major oil exporting regions of the world. It consumes less than 30% of its oil and gas, the remaining proportion is exported. It was estimated that 9.5% of global crude oil reserves and 8% of gas reserves are located in the Sub-Saharan Africa (Sahu, 2008). It was also estimated that 12% of global oil production comes from the Sub-Saharan oil-producing countries. Oil accounts for over 70% of the total exports of Angola, Chad, Congo, Equatorial Guinea, Gabon and Nigeria, and 30 to 40% for Cameroon and Côte d'Ivoire respectively (Qureshi, 2008). Tables 1.1 and 1.2 show the proved oil reserves and production levels in some major oil producing Sub-Saharan African countries, and Table 1.3 shows the exports of oil products in the selected countries of this study.²

¹ The effects of oil price volatility or shocks on international trade are discussed in Chapter Three.

² Proven reserves mean a definite quantity of energy sources estimated with reasonable certainty by geologists.

Table 1.1 Proved Oil Reserves in the Major Oil-producing Sub-Saharan African Countries (Thousand million barrels) (1992 – 2012)

| Country | 1992 | 2002 | 2011 | 2012 |
|----------------|-------------|-------------|-------------|-------------|
| Nigeria | 21.0 | 34.3 | 37.2 | 37.2 |
| Angola | 1.3 | 8.9 | 10.5 | 12.7 |
| Sudan | 0.3 | 0.6 | 5.0 | 1.5 |
| Gabon | 0.8 | 2.4 | 2.0 | 2.0 |
| Congo | 0.7 | 1.5 | 1.6 | 1.6 |

| Equit.Guinea | 0.3 | 1.1 | 1.7 | 1.7 |

Source: BP Statistical Review of World Energy (2013).

As can be seen from Table 1.1 above, Nigeria is the largest oil-producing country in Sub-Saharan Africa and also has the largest oil reserves among the countries presented in the table. Angola is the second largest oil producer after Nigeria in Sub-Saharan Africa and has the second largest oil reserves, and Gabon is the fourth largest oil producer in the region but emerges third in terms of oil reserves capacity. However, as can be observed from Table 1.2 below, in terms of oil production, Nigeria still emerges as the largest oil producer, while Angola, Sudan, Equatorial Guinea and Gabon are the second, third, fourth and fifth largest oil producer in Sub-Saharan Africa respectively.³

Source: BP Statistical Review of World Energy (2013).

Oil resources in Africa are concentrated in a relatively small number of countries and sub-regions, mostly Northern and Western Africa. The eight major oil-exporting countries in Sub-Saharan Africa are Angola, Cameroon, Chad, the Republic of Congo, Côte d'Ivoire, Equatorial Guinea, Gabon, and Nigeria (Qureshi, 2008). Nigeria, Angola and Gabon in particular, have been exporting oil since the

³ It is noteworthy that Sudan is the third largest oil producer in Sub-Saharan Africa, and Equatorial Guinea the fourth after Nigeria and Angola. But, Gabon as the fifth largest oil producer is selected in this study because it started producing and exporting oil earlier than Sudan and Equatorial Guinea.

1960s (Qureshi, 2008). Others like Chad, Côte d'Ivoire, and Equatorial Guinea, started exporting oil in recent years (Qureshi, 2008). The major oil producers in Africa include Nigeria, Algeria, Libya, and Angola (Sahu, 2008). These countries are the largest oil producers in the region. Other producers are Egypt, Sudan, Equatorial Guinea, Congo Republic, Chad, Gabon, Tunisia and Cameroon (Sahu, 2008). Oil in the region covers almost one fifth of the United States oil imports, and one third of China's imports (African Development Bank and African Union, 2009). The oil sector accounts for the majority of exports and economic activity in most of the oil-producing countries of Sub-Saharan Africa such as Nigeria, Angola and Gabon. The huge proportion of exports in these countries is oil products. Table 1.3 below shows the exports of oil products in the three selected countries.

Note: 1 kilo barrel is equivalent to 1,000 barrels.

Globally, oil price shocks have been considered as the major source of economic fluctuations. Hamilton (1983) indicates that all except one of the US macroeconomic downturns since World War II were preceded by higher oil prices. However, since the 1970s, the impact of oil price shocks on macroeconomic variables has been under academic investigation (Gisser and Goodwin, 1976; Mckillop, 2004; Blanchard and Gali, 2007; Aliyu, 2009; Iwayemi and Fowowe,

2011). Over the decades, oil prices have had significant effects on a wide range of macroeconomic indicators and these effects were considered as both real and inflationary (Gisser and Goodwin, 1976). Therefore, since the 1970s, the causes and consequences of oil price shocks and their macroeconomic effects on the oil-exporting as well as oil-importing nations of the world have received a great deal of academic attention (Kilian, 2009). For example, the oil price shock of the 1970s has been adjudged as responsible for the US recessions, for higher inflation, slowdown in the US productivity and for its stagflation respectively (Kilian, 2009). The effects of oil price shocks have been analyzed from their demand and supply channels of transmission to the macro economy (Gisser and Goodwin, 1976; Kilian, 2009).

Historically, oil shocks have been adjudged as the major cause of oil price volatility and as mentioned earlier, the dominant source of macroeconomic fluctuations (Kilian, 2009).

The first oil price shock of the early 1970s occurred from 1973 to 1974 following the OPEC embargo. During that time, Syria and Egypt launched a military attack on Israel and consequently, the Arab members of the Organization of Petroleum Exporting Countries imposed an embargo on oil exports to some countries that were allies of the Israel and consequently, oil production declined thereby putting an upward pressure on the prices (Hamilton, 2011).

The second oil shock occurred as a result of the Iranian revolution of 1978 to 1979, this also was a positive oil shock that occurred consequent to the cut in oil production by Iran. The third oil shock was the outcome of Iran-Iraq War from 1980-1981. At that time (1978 and 1981) the real price of oil had doubled (Kilian 2009, Hamilton, 2011). The fourth oil shock can still be attributed to the Iran Iraq War which led to a precipitous decline in oil prices from 1981 to 1986 following a sharp

fall in oil prices. Because, in 1986, Saudi Arabia had ramped oil production thereby causing a collapse of oil prices from USD 27 per barrel to USD 12 per barrel (Hamilton, 2011). The fifth oil price shock occurred due to the Gulf War in 1990 / 91 which engendered temporary spikes in oil prices internationally which vanished thereafter. From 1997 to 2000 oil prices had fallen due to the Asian crisis following a problem in the financial system of the East Asian countries. The crisis had caused the price of oil to fall below USD 12 in real terms which was the lowest price since 1972. Another episode of oil shock occurred between the second half of 2002 and first half of 2003. It was as result of the Venezuelan unrest and the second Persian Gulf War. This oil shock was characterized by an ephemeral spike in oil prices internationally which vanished in the second half of 2003 (Hamilton, 2011).

Nonetheless, increased demand and stagnant supply was the factor responsible for the positive oil shock witnessed from 2007 to 2008. In 2008, the world had been hard hit by sudden liquidity drain in the global financial system following the global economic and financial crisis which caused a dramatic fall in oil prices internationally (Kilian, 2009; Hamilton, 2010; 2011).⁴ The recent oil shock between June 2014 and March 2015 was the outcome of rapid increase in oil supply especially in the US and a corresponding sharp fall in the demand for oil in the emerging markets, namely China and Brazil (Hou et al., 2015).⁵

Oil price fluctuations often tend to have effects on macroeconomic variables such as exchange rates, inflation, and gross domestic product (Gronwald, 2012). However, the macroeconomic effects of oil price shocks differ across countries on the globe, depending on whether a country is an oil importer or exporter (Krugman,

⁴ It is noteworthy that whilst political factors such as war were said to be responsible for most of the oil shocks, other oil shocks such as the ones of 1973/74; 1979/80 and 2003-2008 were historically said to be caused by fluctuations in the global business cycle (Kilian, 2009).

⁵ The trend of fluctuations in the international oil price is depicted in Figure 1.6

1983). For example, a positive oil price shock causes transfer of wealth from the oil-importing to the oil-exporting countries. It also causes real appreciation of the exchange rates of oil exporters (Krugman, 1983). Moreover, oil price shocks pose serious challenges for policy makers in oil-exporting countries (Kilian, 2009).

Generally, higher oil prices and huge fluctuations of the exchange rates are regarded as the major factors that impede economic growth (Jin, 2008). Appreciation of the real exchange rates of oil-exporting countries following a positive oil shock is termed as the Dutch disease in the literature. The Dutch disease was first investigated by Corden and Neary (1982).⁶ In most oil-exporting countries of the world such as the African oil exporters, real oil prices and real exchange rates tend to co-move (Coleman et al., 2011). Higher oil prices in these countries often render their real exchange rates overly appreciated, and if the real exchange rate of an economy is overvalued, exports of other sectors such as manufacturing and agriculture become expensive internationally, and this has implications for growth. Therefore, the major economic problem in most Sub-Saharan African oil-exporting countries is the highly unstable macroeconomic environment often due to fluctuations in oil prices and their exchange rates (Coleman et al., 2011). Figure 1.1 depicts the international average crude oil price and the exchange rates of the three selected countries of the study, namely Nigeria, Angola and Gabon⁷.

⁶The Dutch disease is the apparent causal relationship between the increase in the economic development of a specific sector for example oil (in the case of the selected countries of the study that export oil products) and a decline in other sectors such as manufacturing and agriculture. This macroeconomic problem is often due to inflow of revenues from the progressing non-tradable sector, thereby making the real exchange rate of the country that produces and exports the natural resource overly appreciated. This in turn has the potential of making the country's exports more expensive and her imports cheaper, which undermines the international competitiveness of the country's export sector and hampers growth respectively.

⁷ It is worth noting that Figure 1.1 above is just a graphical depiction of the oil price and exchange rates of the three selected countries from 1970 to 2012. The exchange rates are period average rates for each country's national currency per US dollar and the oil price is the world average price (US dollars per barrel). The figure shows only a plot of each series, and does not provide any information about their volatilities. Information about volatilities of the series is provided in Figures 1.2, 1.3 and 1.4 respectively.

Figure 1.1 Average World Crude Oil Prices and Exchange Rates of the Selected Countries (1970-2012)

Source: International Monetary Fund, *International Financial Statistics* (2013).

Historically, the price of oil is characterized by a high degree of volatility often resulting from oil shocks following developments on the international oil markets.⁸ Most economic variables are volatile, some are much more so than others. Oil prices and exchange rates are among the economic variables that are highly volatile.⁹ The volatility of oil prices and exchange rates takes two forms, namely rising and falling. In the case of exchange rates, these changes or movements are referred to as appreciation and depreciation. Appreciation of the domestic currency implies a fall in the domestic price of the foreign currency and has the tendency of increasing the import intensity of a country and reducing its export performance, thereby affecting growth. The opposite holds in the case of a depreciation of the

⁸ These developments include both political such as wars and financial such as speculation as Kilian (2009) indicates.

⁹ According to Black (2002) volatility generally implies a liability to fluctuate over time.

domestic currency vis-a-vis the foreign currency. The volatility of both the oil price and exchange rate portend greater risks for trade, growth and economic management.

First, oil price volatility can hamper savings, investment and the gross domestic product (Serven and Solimano, 1993; Hamilton, 1983; 2010, De Pratto et al., 2009). It can also affect the money supply, inflation, consumption, employment and output (Hsieh, 2008; Lescaroux and Mignon, 2008; De Pratto et al., 2009; Hamilton, 2005; Zhou and Wang, 2014). Second, exchange rate volatility can affect trade and economic growth (Wang and Barrett, 2002; Broda, 2004).¹⁰ However, it is widely accepted that financial volatilities move together over time across assets and markets (Laurent, 2009). In other words, there could be volatility spillover from one economic variable to another. If there are correlations in volatilities of two or more economic variables, it implies that there could be volatility spillover effects from one of the variables to another. Usually, the real exchange rates of oil-exporters as earlier highlighted tend to appreciate during periods of booms (rising oil prices), and depreciate during periods of busts (falling oil prices). This implies that there could be volatility spillover effects from the oil price to the exchange rates of oil exporters such as Nigeria, Angola and Gabon. Figures 1.2, 1.3, and 1.4 show the percentage changes (log first difference) of the real oil prices and the real exchange rates of the selected countries. The percentage changes are used as a proxy of volatility in the two variables. As can be observed from Figure 1.2 below, the percentage changes in real oil prices and real exchange rates of Nigeria are almost identical. It can therefore be anticipated that volatilities of the two variables might be correlated over time. Figure 1.2 below indicates that for Nigeria, from 1970 to 2012, there could be

¹⁰ Detailed discussions on the macro economic effects of volatile oil prices and exchange rates are provided in Chapter Three.

correlations between the volatilities of real oil prices and real exchange rates, as the percentage changes of the two variables seem almost identical

Figure 1.2 Monthly Percentage Changes (dlog) in the Real Oil Price and Real Exchange Rate of Nigeria (1970-2012)

Source: International Monetary Fund, *International Financial Statistics* (2013).

Generally, the intuition behind the notion of volatility in economic variables such as oil prices and exchange rates is that periods of low volatility can be expected to be accompanied by another period of low volatility and periods of high volatility can be expected to be accompanied by another period of high volatility which is termed as volatility clustering in the literature.¹¹

¹¹ It is noteworthy that real oil prices were converted into logarithms and computed by dividing the world average crude oil price by the consumer price indices (CPIs) and multiplied by the period average exchange rates of the selected countries, i.e. domestic currency vis-à-vis the US dollar (see Fakhri, 2011). Nonetheless, the real exchange rates were computed by multiplying period average exchange rates as a proxy of the nominal exchange rates by the ratio of the US consumer price index to the consumer price indices of the selected countries. It is noteworthy, however, that the percentage changes / log first difference of the series reflects volatility of the series and were constructed by

Figure 1.3 Percentage Changes in the Real Oil Price (dlogROP) and Real Exchange Rate (dlogRER) of Angola (1996-2012).

Source: International Monetary Fund, *International Financial Statistics* (2013).

As can be observed from Figure 1.3 above, for Angola also, volatility correlations can be expected between the real oil price and real exchange rate as clustering of volatilities of the two variables seems almost identical.

taking first differences of the data and multiplying by 100 [see Koop (2000); Horvath and Johnston (2005)].

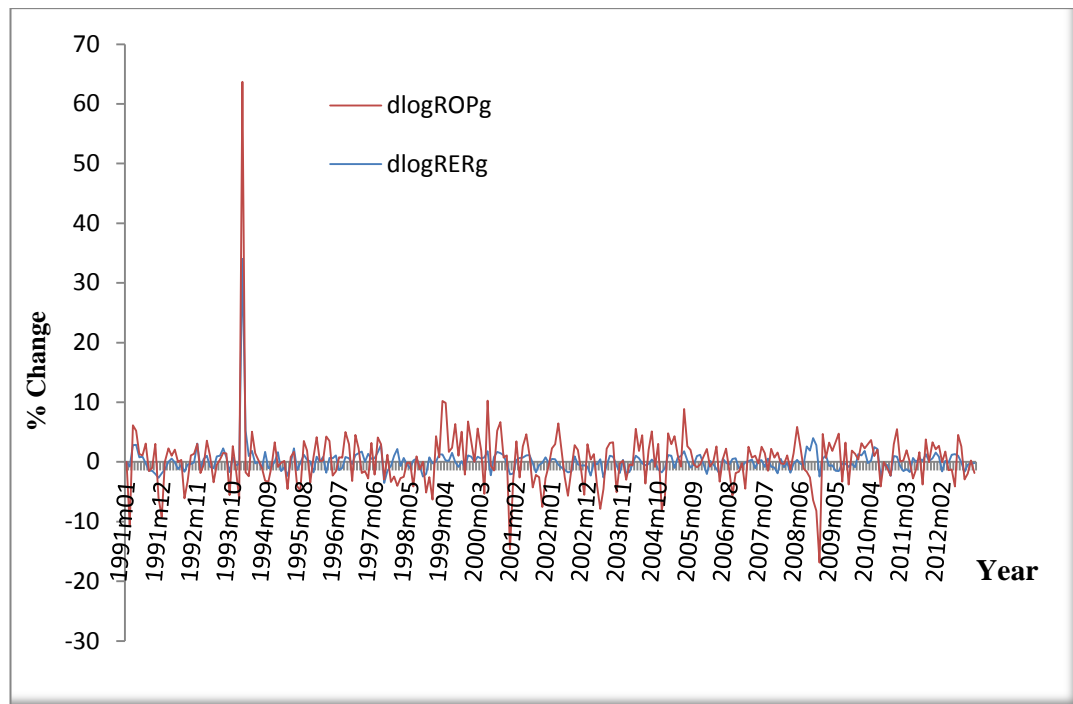

Figure 1.4 Monthly Percentage Changes in the Real Oil Price (dlogROP) and Real Exchange Rate (dlogRER) of Gabon (1991-2012).

Source: International Monetary Fund, *International Financial Statistics* (2013).

Like Nigeria and Angola, for Gabon also, there seems to be a sign of volatility correlations between the real oil price and real exchange rate from 1991 to 2012 as Figure 1.4 above indicates. Volatilities of the two variables seem to be correlated, i.e., co-moving in the same direction as the figure indicates. Krugman (1983) has established theoretically the tendency for the real exchange rates of oil-exporters to appreciate when oil prices rise and to depreciate when oil prices fall. The study shows that the opposite holds for oil importers. In the case of oil exporters, Akram (2002) indicates that theoretically, an oil-exporting country may experience exchange rate appreciation when oil prices rise and depreciation when they fall. Therefore, the volatility of oil price as mentioned earlier could have implications for exchange rates and other macro economic variables such as inflation, money supply, and the gross domestic product whereas the volatility of exchange rates could have implications for trade, balance of payments and economic growth respectively. Figure 1.5 shows how increase in oil prices (booms) may lead to appreciation of the

real exchange rates of oil exporters, and how decrease in oil prices (busts) may cause their exchange rates to depreciate. It is noteworthy that the opposite may hold for oil-importing countries as mentioned earlier.

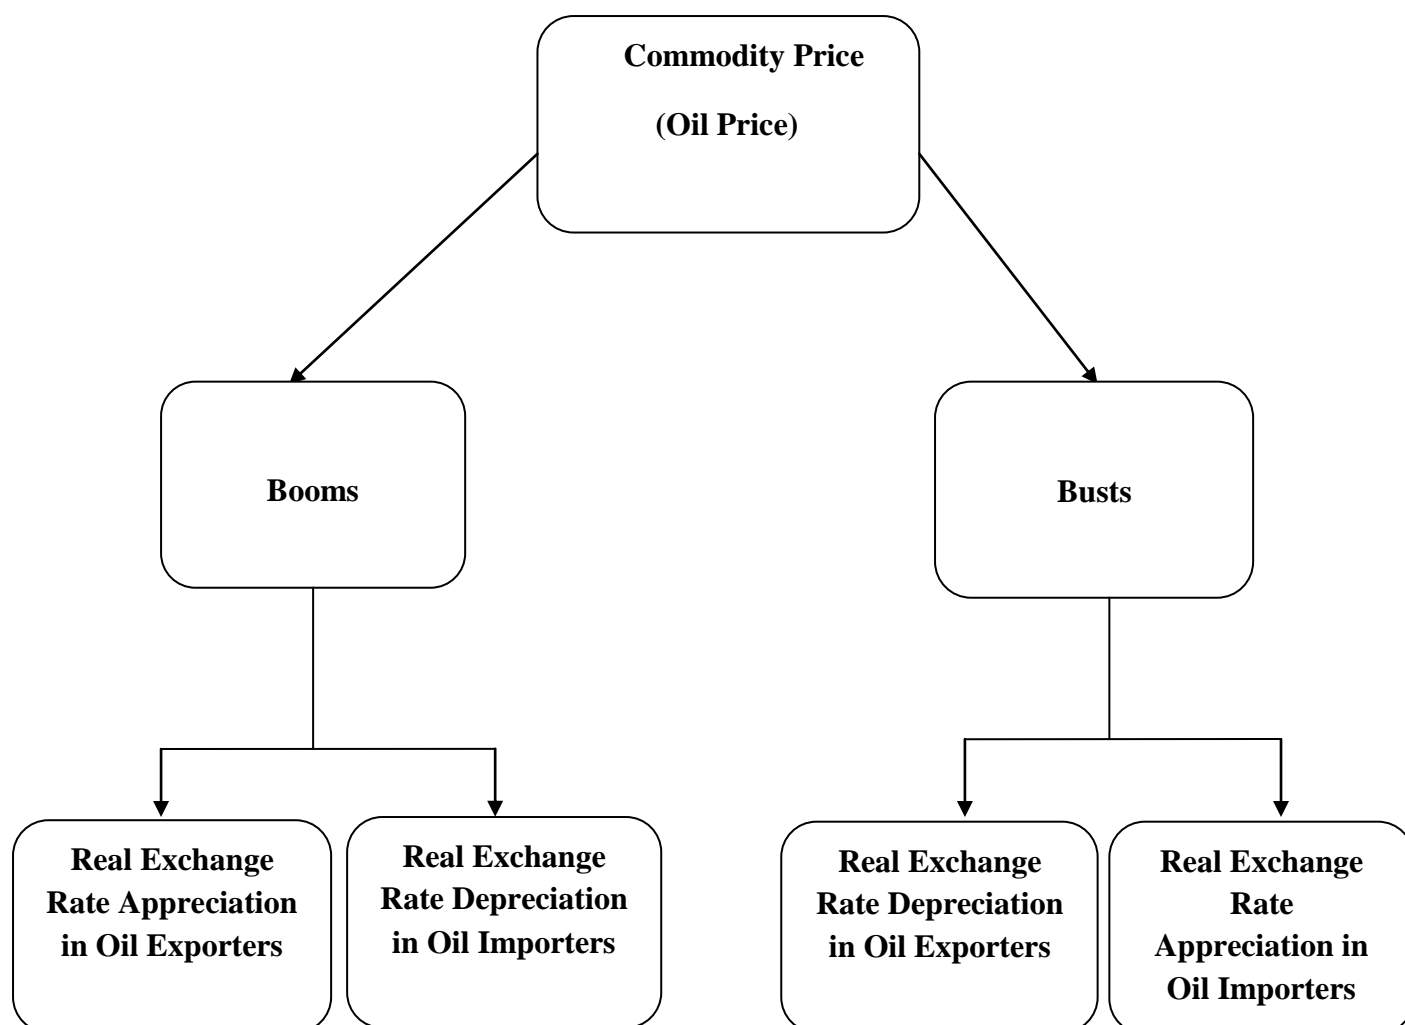

Figure 1.5 A Diagrammatic Depiction of the Effects of Changes in Oil Prices on the Real Exchange Rates of Oil Exporters and Oil Importers
Source: Prepared by the researcher

Internationally, oil prices have been volatile since the first oil price shock of the early 1970s. The 1970s and 1980s, historically, marked the first periods of high volatility in oil prices and exchange rates in Sub-Saharan African oil-exporting countries. The Arab-Israel conflict that occurred at the end of 1973 had led to a very high increase in the price of oil by the Organization of Petroleum Exporting Countries (OPEC) (Pilbeam, 1998). However, since the adoption of structural

adjustment reforms in the 1980s and 1990s, exchange rates in most of the Sub-Saharan African countries became highly volatile (Olayungbo et al., 2010). Most of the countries had in the 1980s and 1990s embarked on economic liberalization reforms that involved the liberalization of exchange rates through the implementation of structural adjustment programs. Historically, the first oil shock of the 1970s had coincided with the shift internationally from the system of fixed exchange rates to that where exchange rates were allowed to float. The high increase in the price of oil during the 1970s had a huge impact on the world economy and brought to a halt any hopes of restoring the fixed exchange rate system (Pilbeam, 1998). Since the 1970s, both oil prices and exchange rates have become highly volatile internationally and since then, the relationship between the two variables has received much attention in the literature (Ozturk et al., 2008). As earlier highlighted, fluctuations of the oil price and exchange rate often tend to have implications for other macroeconomic variables, namely inflation, money supply and the gross domestic product (GDP).

Moreover, macroeconomic shocks generated by fluctuations of the oil price and exchange rates can transmit from the oil-exporting countries to their trading partners through trade links. Therefore, apart from the link between oil prices and exchange rates, their volatilities as well as macroeconomic effects, another thing to which much attention has not been paid, is the issue of trade links between the Sub-Saharan African oil-exporters and their neighbors, and the tendency of transmission of macroeconomic shocks from the oil-exporters of the region onto the neighboring countries. For example, Buiter and Purvis (1980) indicate that the nature of an oil shock is such that a country does not face it in isolation; it is a disturbance which influences its major trading partners simultaneously. Moreover, the IMF (2012) has provided evidence of the existence of a strong informal sector trade relation between

the major oil-exporting countries of Sub-Saharan Africa such as Nigeria and her neighbors. However, a substantial proportion of the trade among the Sub-Saharan African countries takes place in agricultural goods, such as cereals and grains, oil or petroleum products. Therefore, given evidence of trade existence between the selected countries of the study and their neighbors as shown in Tables 1.4, 1.5 and 1.6, it can be anticipated that there could be transmission of macroeconomic shocks from these selected countries, namely Nigeria, Angola and Gabon to their neighboring trading partners. Furthermore, the International Monetary Fund (2012) shows that the increase in Nigeria's fuel prices in January 2012 had a substantial impact on inflation of the Benin Republic (Regional Economic Outlook, 2012).¹² The Tables 1.4, 1.5 and 1.6 below show evidence of intra-regional trade flows between the selected countries of the study and countries that share geographical borders with them.¹³

Note: Imports are valued c.i.f.

Table 1.4 above shows the trade links between Nigeria and the neighboring countries. These countries are Benin, Cameroon, Chad and the Niger Republic. Adding the exports and imports together for the years 2010 to 2012, it implies that

¹² The Benin Republic is one of the countries that shares geographical borders with Nigeria.

¹³ Angola, shares borders with Namibia to the south, Zambia to the east, and the Democratic Republic of the Congo to the north-east, and the South Atlantic Ocean to the west. It is noteworthy, however, that the trade statistics between Angola and Namibia are not available; therefore they are not reported in Table 1.5 below.

there has been an increase in trade between Nigeria and its neighbors with a higher trade volume between Nigeria and Cameroon respectively.

Table 1.5 Angolan Intra-regional Trade with Neighboring Countries (Billions USD) (1985-2012)

| Partner Country | Republic of Congo | | Zambia | |

Note: Imports are valued c.i.f.

From Table 1.5 above, adding exports and imports for each country together, it can be seen that trade flows have been increasing between Angola and the Republic of Congo from 2010 to 2012. Although trade between Angola and Zambia has been increasing over the same period, yet, it is lower in terms of volume compared to the volume of trade between Angola and the Republic of Congo.

Table 1.6 Gabon Intra-regional Trade with Neighboring Countries (Billions USD) (1985-2012)

| Partner Country | Cameroon | | Republic of Congo | | Equatorial Guinea | |
|-----------------|----------|-----------|-------------------|----------|-------------------|---------|

Source: International Monetary Fund, *Direction of Trade Statistics* (2013).

Note: Imports are c.i.f.

Table 1.6 above shows trade flows between Gabon and her neighbors. Adding exports and imports for the three neighboring countries, namely Cameroon, the Republic of Congo and Equatorial Guinea together, it can be seen that from 2010

to 2012 trade among these countries has been increasing with higher trade figures between Gabon and Cameroon.¹⁴

1.2 Oil Prices

The price of oil is determined on the international oil markets and is denominated in U.S dollars (Kilian, 2006). Oil prices have been volatile since the large oil price increase of the 1970s and 1980s (Bacon and Kojima, 2008). Historically, fluctuations in oil prices started from the early 1970s (Oriavwote and Eriemo, 2012). Oil price volatility or shock is often the outcome of three major factors, namely shortage in the supply of oil, increase in the demand for oil, and other factors. Therefore, oil price fluctuations are explained by changes in the supply, demand and other factors. Other factors include political events such as wars and geological incidents. However, it is worth noting that changes in the supply and demand for oil are mostly caused by these other factors, namely political events such as wars (Kilian, 2009). Tables 1.7 and 1.8 below present the world supply and demand for oil from 1990 to 2012.

Table 1.7 World Oil Supply, 1990-2000 (million barrels per day)

| OECD | 1990 | 1995 | 2000 | 2005 | 2010 | 2011 | 2012 |
|---------------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| N/America | 11.0 | 10.8 | 14.0 | 14.9 | 14.1 | 14.6 | 15.7 |
| Europe | 4.3 | 6.3 | 7.1 | 6.0 | 4.0 | 3.8 | 3.5 |
| Pacific | 0.7 | 0.8 | 0.8 | 0.5 | 0.8 | 0.6 | 0.6 |
| Non-OECD | | | | | | | |
| FSU | 11.5 | 6.8 | 7.5 | 11.8 | 13.5 | 13.6 | 13.7 |
| Europe | 0.3 | 0.3 | 0.2 | 0.2 | 0.1 | 0.1 | 0.1 |
| China | 2.8 | 3.0 | 3.1 | 3.5 | 4.0 | 4.1 | 4.2 |
| Other Asia | | 2.1 | 2.3 | 2.7 | 3.7 | 3.6 | 3.6 |
| L/America | 5.4 | 6.3 | 3.9 | 4.4 | 1.6 | 4.2 | 4.2 |
| M/East | 1.3 | 1.9 | 1.9 | 1.9 | 1.6 | 2.6 | 2.3 |
| Africa | 1.9 | 2.2 | 2.9 | 3.8 | 2.5 | 2.1 | 2.1 |
| OPEC | | | | | | | |
| Crude | 22.7 | 25.1 | 27.9 | 29.8 | 29.2 | 29.9 | 31.5 |
| NGLs ¹⁵ | 2.0 | 2.4 | 2.9 | 4.8 | 5.4 | 5.8 | 6.2 |
| Total Supply | 63.9 | 68 | 74.5 | 84.3 | 80.5 | 85 | 87.7 |

Source: International Energy Agency (2012), *Oil Market Reports*.

¹⁴ All figures in Tables 1.4, 1.5, and 1.6 are in billion U.S dollars, and the volume of trade among the countries is computed by adding exports and imports together. Moreover, only the recent years are considered, namely 2010, 2011 and 2012.

¹⁵ NGLs denote Natural Gas Liquids.

As can be seen from Table 1.7 above, the supply of oil by all the three regions, namely the OECD, non-OECD, and OPEC, has increased from 2010 to 2012 with the highest total supply recorded in 2012. Nevertheless, looking at the Table 1.8 below, the demand for oil by the three regions from 2010 to 2012 has also increased, with a higher level of demand in 2012.

Table 1.8 World Demand for Oil (1990-2012)

In the 1970s, particularly from the early, mid and late 1970s, the price of oil had risen. In 1979 in particular, there was a significant rise in oil prices following the Iranian revolution. Nevertheless, after the Iranian revolution in 1979 as can be seen from Figure 1.6, oil prices had fallen and continued to fall until the mid 1980s. But in 1990 the prices had risen due to the Gulf war. Then, from the late 1990s to 2008, the prices had risen again significantly. However, in the second half of 2008, the prices declined precipitously owing to the global economic and financial crisis.¹⁶ The changes in the prices over these periods are depicted in Figure 1.6 below.

¹⁶ The historical chronology of the oil shocks has been discussed previously under section 1.1 of this chapter.

Source: International Monetary Fund, *International Financial Statistics* (2013).

1.3 Exchange Rates

In the history of exchange rates, the 1970s had witnessed a dramatic adjustment in the international monetary system from a regime of pegged exchange rates which had prevailed for about a quarter of a century since the Bretton Woods conference, into a regime of flexible, though managed rates (Dornbusch,1980). Since that shift from a pegged exchange rate system to a flexible exchange rate system, exchange rates of various countries in the world have been fluctuating widely, and hence, the high volatility in exchange rates across countries which prevails until today. In most of the Sub-Saharan African countries, exchange rates have historically been highly volatile since the introduction of the economic liberalization reforms and structural adjustment programs in the 1980s and 1990s. The reforms had involved liberalizing their international trade and foreign exchange rate regimes, which occurred in the 1980s and 1990s (Maehle et al., 2013). Prior to the liberalization, the exchange rate regimes of many of them were hitherto

characterized by stringent administrative control policies. The changes in the exchange rates of the selected countries are presented in Figure 1.1 of this chapter.

1.4 The Global Economic and Financial Crisis

The global economic and financial crisis which had rocked the world in the second half of 2008 had adversely affected the macroeconomic performance of most African countries, especially the oil-producing and exporting nations of Sub-Saharan Africa (Kasekende et al., 2009). The crisis had worsened the already existent macroeconomic instability in the countries as reflected by its adverse effects on their macroeconomic indicators such as inflation, money supply, gross domestic product (GDP), commodity prices such as oil prices and the exchange rates of the countries. For example, Kasekende et al. (2009) have established that oil prices had plummeted by 65% from USD 125.73 per barrel at the inception of the financial crisis to USD 43.98 in January 2009. This had caused a fall in oil revenues in most oil-producing and exporting nations of Sub-Saharan Africa. However, with regards to the effects of the crisis on the exchange rates of the countries, Kasekende et al. (2009) further indicate that in most countries of the continent the impact of the crisis had manifested itself through currency fluctuations, especially against the U.S dollar and the euro.

1.5 Problem Statement

Oil price and exchange rates are important macroeconomic variables and their fluctuations have implications for other macroeconomic variables such as the price level or inflation, money supply and the gross domestic product (GDP) or the overall growth of an economy. The oil price and exchange rate fluctuations can cause macroeconomic instability that can affect economic growth, particularly in the countries that are highly dependent on oil. The oil price and exchange rate

movements can have both the long run and short run effects on an economy. Macroeconomic shocks generated by fluctuations in the price of oil can affect macroeconomic variables of oil-exporting countries of Sub-Saharan Africa and those of their trading partners through the trade transmission effects. Moreover, fluctuations in the oil price and exchange rates can undermine the effectiveness of economic policies designed to achieve growth. Given this problem the study sets out to achieve the following objectives.

1.6 Objectives of the Study

The main objective of this study is to investigate the macroeconomic effects of fluctuations in the oil price and exchange rate in three selected oil-exporting countries of Sub-Saharan Africa, namely Nigeria, Angola and Gabon. Based on this objective, the study seeks to achieve the following sub-objectives:

1. To investigate empirically the volatility spillover from the real oil price to the exchange rate of the selected countries.
2. To examine the long run relationship and the short run dynamics between the real oil price and real exchange rate of the selected countries.¹⁷
3. To examine the transmission of shocks from the oil price and exchange rate to other macroeconomic variables of the selected countries.

¹⁷A long run relationship between the real oil price and the real exchange rate of the selected countries means the existence of a common stochastic trend in the two variables for the selected countries (Enders, 2010). In other words, the objective aims at testing whether or not the variables co-trend together and whether or not they rise and fall at the same time. This is analogous to testing the existence of cointegrating vectors between the variables and how many cointegrating vectors exist if there is any. Examining the short run dynamics between the variables is analogous to testing which of the two variables provides information about the future movements of the other. In other words, the short run causality test between the variables aims at providing information on the direction of causality and whether or not one variable provides information for the prediction of the other variable (Asteriou and Hall, 2011). However, it is noteworthy that the terms long run and short run do not refer to any specific time period. Moreover, it is noteworthy, that for both the first as well as the second objective real rather than nominal variables will be used because Hamilton (2005) establishes that it is real rather than nominal variables that matter for economic decisions. But, due to the paucity of data, nominal variables will be used for the third as well as fourth objectives of the study.

4. To investigate the transmission of macroeconomic shocks from the selected countries onto their neighboring countries.
5. To examine the macroeconomic effects of the 2008 global economic and financial crisis on the selected countries and the transmission of the shock onto their neighboring trading partners.

1.7 Research Questions

1. Are there any volatility correlations between real oil prices and real exchange rates of the selected countries?
2. Is there any long run relationship and short run dynamics between the real exchange rates and the real oil prices of the selected countries?
3. What are the macroeconomic effects of oil price and exchange rate shocks on other macroeconomic variables such as the money supply, inflation and gross domestic product (GDP) in the selected countries?
4. What are the channels of transmission of macroeconomic shocks from the selected countries to the neighboring countries that trade with them?
5. What are the macroeconomic effects of the 2008 global economic and financial crisis on the selected countries and the transmission of the shock onto their neighboring trading partners?

1.8 Significance of the Study

The prices of crude oil and exchange rates can be considered as key research subjects (Huang and Tseng, 2010). Oil price and exchange rate dynamics form an integral aspect of international macroeconomics nowadays. The impact of oil price changes is crucial in studying the effects of exchange rate movements on the macro economy. Yet, empirical studies on the relationship between oil prices and exchange

rates are very limited and scanty on the economies of Sub-Saharan Africa. Therefore, this study is significant for at least three reasons. First, from the literature perspective, although a number of studies have examined the relationship between oil price and exchange rate, yet, there seems to be insufficient empirical evidence on the issue of spillover of volatility from the real oil price to the real exchange rate in Sub-Saharan Africa oil-exporting countries. As such, this study seeks to investigate the three major oil-exporting countries of Sub-Saharan Africa, namely Nigeria, Angola and Gabon simultaneously with regards to the issue of volatility correlations or spillovers between oil prices and their exchange rates, as well as the issue of the macroeconomic effects of volatility of the two variables.

Second, although a plethora of studies have looked at the notion of macroeconomic shocks transmission associated with fluctuations of oil prices, yet, there seems to be a gap in addressing the issue of transmission of macroeconomic shocks from the Sub-Saharan Africa oil-exporting countries onto their neighboring trading partners.

From the econometric methodology perspective, although various studies have approached the relationship between oil prices and exchange rates using different statistical and econometric techniques, yet, there seems to be less attention on the use and application of the multivariate GARCH techniques in examining volatility correlations between the oil price and exchange rate. This study attempts to fill the observed methodological gap.

Moreover, the study will use the panel vector autoregressive (PVAR) techniques in addressing the issue of transmission of macroeconomic shocks from the selected countries onto their neighboring trading partners. To the best of the

researcher's knowledge, this study is the first to apply this econometric technique in addressing this issue in the oil-exporting countries of Sub-Saharan Africa.

1.9 Scope of the Study

The study focuses on the three oil-producing countries of Sub-Saharan Africa, namely Nigeria, Angola and Gabon. The period covered by the study is 1970 to 2012 for Nigeria, 1991 to 2012 for Gabon, and 1996 to 2012 for Angola for the purpose of volatility spillover analysis. It is noteworthy that the period covered for Gabon and Angola is shorter due to unavailability of data from 1970 on the consumer price index (CPI) variable for the two countries, which served as an obstacle for computing the real oil prices and the real exchange rates from 1970 for the two countries. However, for the analysis of macroeconomic effects of oil prices and exchange rates on the selected countries as well as their neighboring trading partners, the period 1970 to 2012 will be used for Nigeria and Gabon as well as their trading partners, while for Angola, only the period 1980 to 2012 can be covered due to unavailability of data from 1970 on the inflation variable for the country and its trading partners.

1.10 Organization of Study

The study comprises of six chapters. The first chapter contains the introduction. The second chapter presents background information about the countries covered by the study. Chapter Three is the literature review, which is dichotomized into the theoretical and empirical literature on the volatility of oil prices, volatility of exchange rates, the relationship between oil prices and exchange rates, oil price shocks and the macro economy, and oil price shocks and their international trade repercussions. Chapter Four contains the methodology to be used

in carrying out the research. Chapter Five discusses the major empirical findings of the study (econometric results) and finally, Chapter Six is the conclusion.
