Received 25 June 2014; accepted 28 June 2014
Edited by J. Simpson, University of Otago, New Zealand

Key indicators: single-crystal X-ray study; $T=296 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.040 ; w R$ factor $=0.099$; data-to-parameter ratio $=16.7$.

In the title molecular salt, $\mathrm{C}_{4} \mathrm{H}_{6} \mathrm{ClN}_{4}{ }^{+} \cdot \mathrm{C}_{5} \mathrm{H}_{7} \mathrm{O}_{4}{ }^{-}$, the cation is essentially planar, with a maximum deviation of 0.037 (1) $\AA$ for all non-H atoms. The anions are self-assembled through $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, forming a supramolecular zigzag chain with graph-set notation $C(8)$. In the crystal, the protonated N atom and the 2 -amino group of the cation are hydrogen bonded to the carboxylate O atoms of the anion via a pair of $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds with an $R_{2}^{2}(8)$ ring motif. This motif further self-organizes through $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{O}-$ $\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, generating an array of six hydrogen bonds, the rings having graph-set notation $R_{3}^{2}(8), R_{2}^{2}(8), R_{4}^{2}(8)$, $R_{2}^{2}(8)$ and $R_{3}^{2}(8)$. In addition, another type of $R_{2}^{2}(8)$ motif is formed by inversion-related pyrimidinium cations via $\mathrm{N}-$ $\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds, forming a two-dimensional network parallel to (101).

## S1. Comment

Pyrimidine derivatives are very important molecules in biology and have many application in the areas of pesticide and pharmaceutical agents (Condon et al., 1993). For example, imazosulfuron, ethirmol and mepanipyrim have been commercialized as agrochemicals (Maeno et al., 1990). Pyrimidine derivatives have also been developed as antiviral agents, such as AZT, which is the most widely-used anti-AIDS drug (Gilchrist, 1997). Glutaric acid (pentanedioic acid) is a dicarboxylic acid with five carbon atoms, occurring in plant and animal tissues. Glutaric acid is found in the blood and urine. It is used in the synthesis of phamaceuticals, surfactants and metal finishing compounds. Alpha-ketoglutaic acid is used in dietary supplements to improve protein synthesis (Windholz, 1976). The related crystal structures of Bis(2,6-di-amino-4-chloropyrimidin-1-ium) fumarate (Thanigaimani et al., 2012a) and 2,6-diamno-4-chloropyrimidine-benzoic acid (1/1) (Thanigaimani et al., 2012b) have been recently reported. In order to study some interesting hydrogen bonding interactions, the crystal structure determination of the title compound, (I), was carried out.
The asymmetric unit of the title compound consists of a 2,6-diamino-4-chloropyrimidinium cation and a hydrogen glutarate anion (Fig. 1). The 2,6-diamino-4-chloropyrimidinium cation is essentially planar, with a maximum deviation of 0.016 (1) $\AA$ for atom N1. In the 2,6-diamino-4-chloropyrimidinium cation, a wider than normal angle [C1-N1-C6 = $121.44(12)^{\circ}$ ] is subtented at the protonated N 1 atom. In the hydrogen glutarate anion, $\mathrm{C} 5 / \mathrm{C} 6 / \mathrm{C} 7 / \mathrm{C} 8 / \mathrm{C} 9$ plane makes a dihedral angle of 9.67 (12) ${ }^{\circ}$ with 2,6-diamino-4-chloropyrimidinium cation. The backbone conformation of the hydrogen glutarate anion can be described by the two torsion angles C5-C6-C7-C8 of -171.89 (13) and C6-C7-C8-C9 of $-176.36(13)^{\circ}$. As evident from the torsion angles, the hydrogenglutarate anion is in a fully extended conformation (Saraswathi et al., 2001) of the two carboxyl groups, one is deprotonated while the other is not. The bond lengths and angles (Allen et al., 1987) are within normal ranges.
In the crystal packing, the protonated N atom the 2 -amino group of the cation are hydrogen bonded to the carboxylate O atoms of the anion via a pair of $\mathrm{N} 1-\mathrm{H} 1 \mathrm{~N} 1 \cdots \mathrm{O} 1^{\mathrm{iv}}$ and $\mathrm{N} 4-\mathrm{H} 2 \mathrm{~N} 4 \cdots \mathrm{O} 2^{\text {iv }}$ hydrogen bonds (symmetry code in Table 1), forming $R_{2}{ }^{2}(8)$ (Bernstein et al., 1995) ring motif. This motif further self organizes through N4—H1N4‥ $\mathrm{O}^{\mathrm{i}}$, $\mathrm{N} 2-$ $\mathrm{H} 1 \mathrm{~N} 2 \cdots \mathrm{O} 4{ }^{\mathrm{iii}}$ and $\mathrm{O} 4-\mathrm{H} 1 \mathrm{O} 4 \cdots \mathrm{O} 1^{\mathrm{v}}$ hydrogen bonds (symmetry code in Table 1), to generate an array of six hydrogen bonds with the rings having the graph-set notations of $R_{3}{ }^{2}(8), R_{2}{ }^{2}(8), R_{4}{ }^{2}(8), R_{2}{ }^{2}(8)$ and $R_{3}{ }^{2}(8)$. The hydrogen glutarate anion self-assemble via $\mathrm{O} 4-\mathrm{H} 1 \mathrm{O} 4 \cdots \mathrm{O} 1$ hydrogen bonds to form a one-dimensional supramolecular zigzag infinite chain, with the graph-set notation $\mathrm{C}(8)$; this is shown in Fig. 2. This type of head-to-tail fashion of hydrogen glutarate ions has also been observed in the crystal structure of pyrimethamine hydrogen glutarate (Stanley et al., 2002). The inversion-centre-related to the 2,6-diamino-4-chloropyrimidinium cations are also base-paired via $\mathrm{N} 2-\mathrm{H} 2 \mathrm{~N} 2 \cdots \mathrm{~N} 3{ }^{\text {ii }}$ hydrogen bonds involving the unprotonated pyrimidine N atom and the 2-amino group (symmetry code in Table 1). This type of base pairing, also with an $R_{2}{ }^{2}(8)$ motif, has been observed in many diaminopyrimidiniumcarboxylate salts (Thanigaimani
\& Muthiah, 2010). These ring motifs extend to give a sheet parallel to (101) plane as shown in Fig 3.

## S2. Experimental

Hot methanol solutions ( 20 ml ) of 2,6-diamino-4-chloropyrimidine ( 36 mg , Aldrich) and glutaric acid ( 33 mg , Merck) were mixed and warmed over a heating magnetic stirrer hotplate for a few minutes. The resulting solution was allowed to cool slowly at room temperature and crystals of the title compound (I) appeared after a few days.

## S3. Refinement

$\mathrm{O}-$ and N -bound H atoms were located in a difference Fourier maps and allowed to be refined freely $[\mathrm{O}-\mathrm{H}=0.94$ (3) $\AA$ and $\mathrm{N}-\mathrm{H}=0.85(2)-0.94(3) \AA$ ]. The remaining hydrogen atoms were positioned geometrically $[\mathrm{C}-\mathrm{H}=0.93-0.97 \AA$ ] and were refined using a riding model, with $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C})$.

```

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
