**Thesis submitted in fulfillment of the requirements  
for the degree of  
Doctor of Philosophy**

**May 2016**

## ACKNOWLEDGMENT

I would like to thank the people who have deserved to be mentioned for supporting me and contributing to this work, I have been studying for over four years in Universiti Sains Malaysia. I would never have been able to finish my dissertation without the guidance of my supervisor and co-supervisors, help from friends, and support from my family and wife. First of all, I would like to thank my supervisor, Dr. Norlaili Mohd. Noh, for her meticulous thinking, excellent guidance, caring, patience, and providing me with an excellent atmosphere for doing research. She always tried to give advice and help me as soon as needed. I would like to thank her for taking some time to read this thesis and give constructive feedback led to significant improvement, despite her busy schedule.

I would like to thank Dr. Mohd Tafir Mustaffa, as my co-supervisor, for encouragement, insightful comments and financially supporting my research. I am extremely thankful and indebted to Dr. Asrunizam Abd Manaf, for helping me to develop my background in MEMS, sharing expertise in CMOS-MEMS process, and for his valuable guidance.

I really can say it was a big honor for me to be working with Advanced Integrated System Device Group (AISDe) in School of Electrical and Electronic Engineering.

I wish to express my sincere thanks to CEDEC, for providing me with all the necessary facilities and EDA tools for the research. I am also grateful to Mr. Kusairay for supporting me with EDA tools, Mr. Hasnirol for measurements and Mr. Shukri for his method and guidance in on-chip measurement that greatly assisted the research.

I place on record, my sincere thank you to SilTerra Fab which provided me free fabrication for my designs. I would like to thank Ms. Awatif for her great helps on

MPW processes. I would like to thank Mr. Yusman and his modeling team in SilTerra for providing me the fabrication opportunity in SilTerra fab.

I take this opportunity to express gratitude to all of the department faculty members for their help and support especially Mr. Rahmat for his great helps in handling all official jobs and Ms. Sharida for handling grant works.

And special thanks to my friend, Mr. Hamidreza Ameri for his great advices on chip layouts and transferring his experiences in fabrication.

This research was supported by Universiti Sains Malaysia research university (RU) grant No. 1001/PELECT/814107, postgraduate research grant scheme (PRGS) No. 1001/PELECT/8045003 and exploratory research grant scheme (ERGS) No. 203/PELECT/6730112. I thank our colleagues from school of electrical and electronic engineering who provided insight and expertise that greatly assisted the research.

I would also like to thank my parents and elder brothers. They were always supporting me and encouraging me with their best wishes.

Finally, I would like to thank my wife, Fatemeh Banitorfian. She was always there cheering me up and stood by me through the good and bad times.

I also place on record, my sense of gratitude to one and all, who directly or indirectly, have let their hand in this venture.

## TABLE OF CONTENTS

ACKNOWLEDGMENT .....	ii
TABLE OF CONTENTS .....	iv
LIST OF TABLES .....	x
LIST OF FIGURES .....	xiii
LIST OF ABBREVIATIONS .....	xxvi
ABSTRAK .....	xxviii
ABSTRACT .....	xxx
CHAPTER 1 - INTRODUCTION	
1.1 Background .....	1
1.2 Motivation .....	4
1.3 Problem statements .....	6
1.4 Objectives .....	7
1.5 Research Scopes and limitations .....	7
1.6 Thesis Outline .....	9
CHAPTER 2 – LITERATURE REVIEW	
2.1 Radio Receiver .....	11
2.1.1 Modern Reconfigurable Receivers for Multi-standard Wireless Applications .....	11

2.2	Low-Noise Amplifiers .....	16
2.2.1	LNA topology choice .....	17
2.2.2	Linearization .....	19
2.2.3	The inductive source-degenerated cascode amplifier .....	23
2.2.4	Impedance matching .....	24
2.2.5	Noise .....	32
2.2.6	Noise optimization .....	37
2.3	Frequency reconfigurability in low-noise amplifiers .....	47
2.3.1	Switched tunable capacitance .....	50
2.3.2	Switched transistor's parameters .....	58
2.3.3	Switched tunable inductance .....	61
2.4	Summary .....	63

## CHAPTER 3 - METHODOLOGIES

3.1	Design methodology .....	65
3.2	PCSNIM-based ISD cascode LNA .....	71
3.2.1	Input circuitry design flow .....	71
3.2.2	Cascode stage design flow .....	75
3.2.3	Power gain .....	77
3.2.4	Summary of design steps for PCSNIM-based single-band ISD cascode LNA .....	77
3.2.5	Layout .....	79

3.2.6	Optimization and implementation .....	79
3.2.7	Components Values .....	82
3.3	Proposed hybrid Switched Capacitances Technique .....	83
3.3.1	Input-Circuitry Design flow .....	85
3.3.2	Switchable components selection and calculation for output reconfigurability .....	87
3.3.3	Power gain .....	89
3.3.4	Noise analysis .....	90
3.3.5	Summary of design steps for the proposed hybrid Switched Capacitances Technique .....	94
3.3.6	Layout .....	95
3.3.7	Optimization and implementation .....	96
3.3.8	Components Values .....	97
3.4	Proposed hybrid switched transistor-width/transconductance/Miller- capacitance technique .....	98
3.4.1	Input-Circuitry Design flow .....	102
3.4.2	Switchable components selection and calculation for output reconfigurability .....	104
3.4.3	Power Gain .....	105
3.4.4	Noise analysis .....	106
3.4.5	A summary of design steps for proposed hybrid switched transistor-width/transconductance/miller-capacitance technique	110

3.4.6	Layout .....	111
3.4.7	Optimization and implementation .....	113
3.4.8	Components Values .....	114
3.5	Proposed transformer-based variable inductance technique.....	116
3.5.1	Input-Circuitry Design Flow.....	118
3.5.2	Switchable components selection and calculation for output reconfigurability .....	127
3.5.3	Power Gain .....	128
3.5.4	Noise Analysis .....	129
3.5.5	Summary of design steps for proposed transformer-based variable inductance technique .....	135
3.5.6	Layout .....	137
3.5.7	Optimization and implementation .....	138
3.5.8	Component values .....	139
3.6	Proposed die-level 3D EM-analysis for improved post-layout parasitic extraction.....	140
3.6.1	The advantages of EM simulation for PLS.....	143
3.6.2	Post-Layout EM Simulation Approach .....	144
3.6.3	Simulation procedure.....	159
3.7	Measurement procedures .....	162
3.7.1	S-Parameters .....	165
3.7.2	Linearity.....	165

3.7.3	Noise figure .....	169
3.7.4	Stability factor .....	172

## CHAPTER 4 – RESULTS AND DISCUSSIONS

4.1	PCSNIM-based ISD cascode LNA.....	173
4.1.1	Prelayout Simulation .....	173
4.1.2	LNA die .....	178
4.1.3	Post-layout Simulation vs. Measurement .....	179
4.1.4	Summary of Results.....	189
4.2	Hybrid Switched capacitances technique.....	190
4.2.1	Prelayout simulation .....	190
4.2.2	LNA die .....	195
4.2.3	Post-layout simulation vs. measurement .....	196
4.2.4	Summary of Results.....	213
4.3	Hybrid switched transistor-width/transconductance/Miller-capacitance technique .....	215
4.3.1	Prelayout simulation results.....	215
4.3.2	LNA die .....	221
4.3.3	Post-layout simulation vs. measurement .....	222
4.3.4	Summary of Results.....	241
4.4	Transformer-based variable inductance technique .....	242
4.4.1	Prelayout simulation results.....	242

4.4.2	LNA die .....	247
4.4.3	Post-layout simulation vs. measurement results .....	249
4.4.4	Summary of Results .....	264
4.5	Proposed die-level 3D EM-analysis for improved post-layout parasitic extraction.....	265
4.5.1	Summary of results .....	268
4.6	Summary .....	270

## CHAPTER 5 - CONCLUSION

5.1	Accomplishment .....	281
5.2	Future works .....	283

Figure 4.22	Measured $IIP_3$ for (a) LB- and (b) UB modes.	211
Figure 4.23	Measured $P_{1dB}$ for (a) LB- and (b) UB modes.	211
Figure 4.24	PLS and measured stability factor with (a) $K - \Delta$ evaluation and (b) $\mu$ evaluation, in LB mode.	212

Figure 4.25	PLS and measured stability factor with (a) $K - \Delta$ evaluation and (b) $\mu$ evaluation, in UB mode.	213
Figure 4.26	Prelayout simulated S-parameters (a) $ S_{11} $ , (b) $ S_{12} $ , (c) $ S_{21} $ and $ S_{22} $ .	217
Figure 4.27	Prelayout simulated noise figure and minimum noise figure of proposed LNA with variable gate inductor in LB and UB modes.	219
Figure 4.28	Prelayout simulated stability Factor (a) $K$ factor, the stability condition is $K > 1$ and $\Delta < 1$ , and (b) $\mu$ factor, the stability condition is $\mu > 1$ .	220
Figure 4.29	The micrograph of dual-band frequency-reconfigurable PCSNIM-based ISD cascode LNA die using switched hybrid transistor-width/transconductance/Miller-capacitance technique.	222
Figure 4.30	Measured $I_{DD} - V_{GS}$ in LB and UB modes for dual-band ISD cascode LNA using switched hybrid transistor-width/transconductance/Miller-capacitance technique.	223
Figure 4.31	PLS and Measured S-parameters in LB mode (a) $ S_{11} $ , (b) $ S_{12} $ , (c) $ S_{21} $ and (d) $ S_{22} $ .	225
Figure 4.32	PLS and Measured $S_{11}$ and $S_{22}$ in Smith chart in LB mode.	226
Figure 4.33	PLS and Measured S-parameters in UB mode (a) $ S_{11} $ , (b) $ S_{12} $ , (c) $ S_{21} $ and (d) $ S_{22} $ .	230
Figure 4.34	PLS and Measured $S_{11}$ and $S_{22}$ in Smith chart in UB mode.	231

Figure 4.35	PLS noise figure, PLS minimum noise figure and measured NF of dual-band PCSNIM-based LNA with hybrid switched transistor's width/transconductance/gate-drain capacitance technique in (a) LB- and (b) UB modes.	235
Figure 4.36	Measured $IIP_3$ for (a) LB- and (b) UB modes.	236
Figure 4.37	Measured $P_{1dB}$ for (a) LB- and (b) UB modes.	238
Figure 4.38	PLS and measured stability factor with (a) $K - \Delta$ evaluation and (b) $\mu$ evaluation, in LB mode.	239
Figure 4.39	PLS and measured stability factor with (a) $K - \Delta$ evaluation and (b) $\mu$ evaluation, in UB mode.	240
Figure 4.40	Prelayout simulated S-parameters (a) $ S_{11} $ , (b) $ S_{12} $ , (c) $ S_{21} $ and (d) $ S_{22} $ .	244
Figure 4.41	Prelayout simulated noise figure and minimum noise figure of proposed LNA with variable gate inductor in LB and UB modes.	245
Figure 4.42	Prelayout simulated stability Factor (a) $K$ factor, the stability condition is $K > 1$ and $\Delta < 1$ , and (b) $\mu$ factor, the stability condition is $\mu > 1$ .	246
Figure 4.43	The micrograph of dual-band frequency-reconfigurable PCSNIM-based ISD cascode LNA die using transformer-based variable inducor technique.	248
Figure 4.44	PLS and Measured S-parameters in LB mode (a) $ S_{11} $ , (b) $ S_{12} $ , (c) $ S_{21} $ and (d) $ S_{22} $ .	250
Figure 4.45	PLS and Measured $S_{11}$ and $S_{22}$ in Smith chart in LB mode.	251
