UNIVERSITI SAINS MALAYSIA**

**BORANG PENYERAHAN DISERTASI MUTAKHIR
SATU (1) NASKAH**

Nama penyelia: _Dr Uthumporn Utra @ Sapina Abdullah

Bahagian: Teknologi Makanan

Saya telah menyemak semua pembetulan/pindaan yang dilaksanakan oleh

Encik/Puan/Cik: Tan Kwan Liang

mengenai disertasinya sebagaimana yang dipersetujui oleh Panel Pemeriksa di *Viva Voce*-nya.

2. Saya ingin mengesahkan bahawa saya berpuas hati dengan pembetulan/
pindaan yang dilaksanakan oleh calon.

Sekian, terima kasih.

**THE EFFECT OF DIFFERENT PINEAPPLE
RIPENESS ON THE PHYSICOCHEMICAL,
MICROBIOLOGICAL PROPERTIES OF
FERMENTED KEFIR DRINK**

by

TAN KWAN LIANG

A dissertation submitted in partial fulfillment of the requirement for the degree of
Bachelor of Technology (B. Tech) in the field of Food Technology
School of Industrial Technology
University Science Malaysia

June 2020

DECLARATION BY AUTHOR

This dissertation is composed of my original work, and contains no material previously published or written by another person except where due reference has been made in the text. The content of my dissertation is the result of work I have carried out since the commencement of my research project and does not include a substantial part of work that has been submitted to qualify for the award of any other degree or diploma in any university or other tertiary institution.

TAN KWAN LIANG

ACKNOWLEDGEMENTS

This study will not succeed without the help and support of certain individuals who sacrificed their time and effort for me throughout the study period.

First and foremost, I would like to express my profound gratitude to my supervisor, Dr Uthumporn Utra @ Sapina Abdullah for introducing me the application of water kefir in food production which is rarely to be seen in Malaysia. The guidance, continuous support, suggestion and insightful comments given by her throughout the whole study which lead to the success are deeply appreciated.

Secondly, I would like to thank my examiner, Dr Abdoredza, for given me advice and suggestion to improve my study.

A great gratitude to all the Laboratory Assistants, starting from Pn Mazura Md Nayan, En Abdul Rahim Md Sari, En Maarof Salleh, En Abdul Ghoni Ruslan and En Mohamad Firdaus Mohd Adnan for their guidance and expertise given along the study. Besides, my sincere appreciation goes to all the postgraduate students especially Lim Xiao Xian, Master's Degree student, Koh Wee Yin, PhD student under supervision of Dr Uthumporn Utra @ Sapina Abdullah, for their guidance and helps throughout the whole study.

Finally, I would like to dedicate my heartiest appreciation to my family and friends for their help, support, understanding and motivation in making the study success.

TAN KWAN LIANG

**KESAN PERBEZAAN KEMASAKAN NANAS TERHADAP FIZIKOKIMIA
DAN MIKROBIOLOGIKAL KEFIR YANG DITAPAI**

ABSTRAK

Nanas MD2 mempunyai enam indeks kematangan berdasarkan piawaian dari Malaysia Pineapple Industry Board (2018) tetapi hanya dua peringkat kemasakan telah digunakan dalam eksperimen ini iaitu Indeks 2 yang mewakili kategori tidak masak manakala Indeks 4 mewakili kategori masak. Nanas MD2 didapati boleh menjadi substrat yang baik untuk membuat minuman probiotik bukan tenusu seperti minuman kefir dengan penapaian jus nanas MD2 bersama-sama dengan bijiran air kefir. Walau bagaimanapun, kematangan nanas yang berbeza boleh menghasilkan sifat yang berbeza daripada ciri-ciri minuman kefir, oleh itu kategori mentah (Indeks 2) dan kategori matang (Indeks 4) telah dipilih untuk menilai dan mengkaji kesan kematangan nanas MD2 yang berbeza terhadap sifat fizikokimia dan mikrobiologi minuman kefir dalam eksperimen ini supaya minuman probiotik bukan tenusu yang alternatif boleh dihasilkan untuk menggantikan minuman probiotik ternusu untuk vegetarian dan pengguna yang mempunyai alahan terhadap laktosa. Kefir nanas dihasilkan dengan menambah 5 g daripada kefir (5%) dan 100 ml jus nanas. Kemudian, penapaian telah dijalankan pada suhu 25 ° C selama 24 jam. Dari eksperimen, minuman kefir yang masak mempunyai fenolik tertinggi (0.09 ± 0.00) berbanding dengan minuman kefir nenas mentah dan kawalannya. Hal ini disebabkan nanas itu sendiri kaya dengan sebatian polyfenol seperti asid p-coumaric, asid ferulic, asid kafeik, asid sinapik, p-coumaroyl asid, dan sebatian polyfenols yang kompleks telah ditukarkan kepada polyfenols yang kecil oleh mikroorganisma dari kefir semasa penapaian. Analisis kandungan antioksidan telah dijalankan, dan ia menunjukkan bahawa minuman kefir nenas mentah (UR) (26.88 ± 9.55) adalah jauh lebih tinggi daripada kawalannya (CUR)

(1.30 ± 0.11). Ini mungkin disebabkan oleh proses oksidasi mencetuskan mekanisme pertahanan buah yang disebabkan oleh tekanan oksidatif dan membawa kepada antioksidan yang dikeluarkan ke dalam kefir semasa penapaian. Tambahan pula, jumlah gula dalam sampel masak (8.26 ± 1.53) dan sampel yang tidak masak (4.50 ± 0.78) adalah jauh lebih rendah daripada kawalan selepas penapaian kerana perpecahan daripada jus nanas dipecahkan kepada gula yang dikurangkan untuk digunakan sebagai substrat untuk penapaian. Kemudian, jumlah pepejal larut berkurangan selepas penapaian, sampel berpigmen (R) (6.85 ± 0.07) dan sampel kefir nanas mentah (5.15 ± 0.07) adalah jauh lebih rendah daripada kawalan kerana gula dalam jus nanas telah digunakan untuk penapaian untuk menghasilkan metabolit lain oleh mikroorganisma. Dalam ujian pH, ia didapati mengawal sampel masak (CR) (4.05 ± 0.01) adalah jauh lebih tinggi daripada sampel masak (R) (3.99 ± 0.01). Ini mungkin disebabkan oleh pengeluaran asid laktik yang menyebabkan pH kefir untuk mengurangkan selepas penapaian. Dalam ujian keasidan, semua sample minuman kefir tidak mempunyai perbezaan dalam kandungan asid laktik, oleh disebabkan penapaian memerlukan masa yang panjang untuk melihat perbezaan yang lebih besar. Dalam ujian microbiologi, kefir nanas yang masak dan kefir nanas mentah telah mencapai standard Codex minimum kefir untuk kiraan bakteria total (1×10^7 cfu/ml), dan kiraan yis (1×10^4 cfu/ml). Walau bagaimanapun, kefir nanas yang matang mempunyai sifat yang baik dan sesuai menjadi minuman probiotik alternatif kepada pengguna vegetarian dan pengguna yang mempunyai alahan terhadap laktosa.

**THE EFFECT OF DIFFERENT PINEAPPLE RIPENESS ON THE
PHYSICOCHEMICAL AND MICROBIOLOGICAL PROPERTIES OF
FERMENTED KEFIR DRINK**

ABSTRACT

MD2 pineapple consists of 6 indices of ripeness according to Malaysian Standards (2018) but only two ripeness stage was used in this experiment which were Index 2 that represented unripe while Index 4 represents ripe stage. It was found that pineapple can make a good substrate for the making of non-dairy probiotic drink such as kefir drink by fermenting MD2 pineapple juice together with water kefir grains. However, different ripeness of pineapple could yield different properties of the fermented kefir drink, therefore unripe stage (Index 2) and ripe stage (Index 4) were selected to evaluate and to study the effect of different ripeness of the MD2 pineapple on the physicochemical and microbiological properties of the fermented kefir drink in this experiment so that an alternative non-dairy probiotic drink can be produced to replace dairy probiotic drink for vegetarians and lactose intolerance consumers. The pineapple kefir was made by adding 5 g of kefir (5%) and 100 ml of the pineapple juice. Then, the fermentation was conducted at a temperature of 25 °C for 24 hours. From the experiment, it was found that riper pineapples have a higher phenolic content than unripe pineapples. Ripe pineapple kefir drink has the highest phenolic (0.09 ± 0.00) compared to unripe pineapple kefir drink and its control. This was because pineapple itself were rich in polyphenol compounds such as p-coumaric acid, ferulic acid, caffeic acid, sinapic acid, p-coumaroyl quinic acid as it ripened, and the complex polyphenols compounds were hydrolyzed by the microorganisms from the kefir during

fermentation. Antioxidant content analysis was conducted, and it showed that unripe pineapple kefir sample (UR) (26.88 ± 9.55) was significantly higher than its control (CUR) (1.30 ± 0.11). This could be due to the ripening process triggered the defense mechanism of the fruit due to oxidative stress and lead to antioxidants being released into the kefir during fermentation. Furthermore, it was found that the total sugars in ripe sample (8.26 ± 1.53) and unripe sample (4.50 ± 0.78) were significantly lower than its controls after fermentation because of disaccharides from the pineapple juice being broken down to its reducing sugar to be used as substrate for fermentation. Then, the total soluble solids decreased after fermentation, fermented ripe sample (R) (6.85 ± 0.07) and unripe sample (5.15 ± 0.07) were significantly lower than its controls because the sugars in the pineapple juice were used for fermentation to produce other metabolites by microorganisms. In pH test, it was found control ripe sample (CR) (4.05 ± 0.01) was significantly higher than ripe sample (R) (3.99 ± 0.01). This could be due to the production of lactic acid which cause the pH of the kefir to decrease after fermentation. In titratable acidity, there was no significant difference in all the samples, it could be due to fermentation time, longer fermentation time was needed. In microbiological test, ripe pineapple kefir and unripe pineapple kefir had achieved the minimum codex standard of kefir for total bacterial count, and yeast count. However, ripe pineapple kefir drink overall was seen to exhibit good nutritional properties and suitable to be an alternative for vegetarians and lactose intolerance consumers
