ACKNOWLEDGEMENT

I wish to convey my heartiest thanks to my supervisors Dr. Ali Memon and Dr. Mohammad Idris Salleh for their invaluable guidance and advice.

I also wish to express my special thanks to the laboratory assistants Mr. Yee Chin Leng and Mr. Oon Liang Gan who have assisted me in carrying out some experiments.

The author wishes to express his heartiest thanks to BEH Minerals Sdn. Bhd., Ipoh, Perak for providing the analytical sample and to Eastern Smelting Corporation, Jalan Dato' Keramat, Penang for running the x-ray fluorescence spectroscopic analysis.

ABSTRAK

Analisa beberapa logam surih didalam bijih timah yang boleh didapati secara komersial sebagai " Amang Feed " telah dijalankan secara kualitatif dan kuantitatif.

Analisa secara kualitatif telah dijalankan dengan menggunakan kaedah-kaedah klasik basah, ujian-ujian sepong dan kromatografi kertas satu dimensi dan dua dimensi. Kehadiran logam-logam besi, zink, aluminium, antimoni dan bismus telah dikesan dan ditentukan dengan kaedah-kaedah klasik basah dan ujian-ujian sepong. Kehadiran aluminium dan zink selanjutnya telah ditentukan dari eksperimen eksperimen kromatografi kertas. Eksperimen eksperimen kromatografi kertas juga dapat memberikan tanda tanda yang menasabah bagi kehadiran logam logam bismus dan antimoni. Sebagai tambahan, analisa dengan menggunakan kaedah pendafluoro sinar x memperlihatkan kehadiran logam logam zirkonium, niobium, tantalum, titanium, kalsium, zink dan besi juga.

Analisa secara kuantitatif telah dijalankan dengan menggunakan kaedah spektroskopi penjerapan atom. Keputusan keputusan kuantitatif ditunjukkan didalam jadual berikutnya.

Ringkasan keputusan keputusan kuantitatif

Unsur	Fe	Sb	Bi	Zn	Al
Kepekatan (ppm)	148.00	0.50	0.50	0.23	1.15
" Assay " (%)	~1.85	~0.01	~0.01	<0.01	~0.01

ABSTRACT

Analysis, both qualitative and quantitative, was carried out for some trace metals in a tin ore commercially available as " Amang Feed ".

Qualitative analysis was carried out by classical wet methods, spot tests, one-dimensional and two-dimensional paper chromatography. The presence of iron, zinc, aluminium, antimony and bismuth were detected and confirmed by the classical wet methods and the spot methods. The presence of aluminium and zinc was further confirmed by the paper chromatographic experiments. The paper chromatographic experiments also provided a reasonable hint for the presence of bismuth and antimony. In addition, the x-ray fluorescence analysis revealed the presence of zirconium, niobium, tantalum, titanium, calcium, zinc and iron also.

Quantitative analysis was carried out by atomic absorption spectroscopy. The quantitative results are summarized in the following table.

Summary of quantitative results

Element	Fe	Sb	Bi	Zn	Al
Concentration (ppm)	148.00	0.50	0.50	0.23	1.15
Assay (%)	~ 1.85	~ 0.01	~ 0.01	< 0.01	~ 0.01
