TEKS F

Sometimes insects are disinclined to collect pollen, preferring nectar, or will pack it away in places from which it is not easily dislodged. Then the flowers have to have devices to force their pollen on the insect. Some blooms have become obstacle courses during which their visitors are pummelled by stamens and bombarded with pollen before they are able to leave. Broom flowers are so constructed that as the insect lands, the stamens, packed under tension inside a sealed capsule of petals, shoot out and strike the underside of the bee, covering its furry abdomen with pollen. The bucket orchid from Central America drugs its visitors.

TEKS G

What are Angioplasty and Vascular Stenting?

Angioplasty, also called balloon angioplasty, and **vascular stenting** are minimally invasive **procedures** performed by an **interventional radiologist** to improve **blood flow** in the body's arteries.

In the angioplasty procedure, the physician threads a balloon-tipped **catheter**—a thin, plastic tube—to the site of a narrow or blocked artery and then inflates the balloon to open the vessel. The balloon is then deflated and removed from the artery. Vascular stenting, which is often performed at the same time as an angioplasty, involves the placement of a small wire mesh tube called a stent in the newly opened artery. This may be necessary after some angioplasty procedures if the artery is very narrowed or completely blocked. The stent is a permanent device that is left in the artery and may be needed to help the artery heal in an open position after the angioplasty.
