ACKNOWLEDGEMENT

First and foremost, in the name of Allah, the most gracious and the most graceful I would like to say a huge of thanks finally I could finish my research project as planned. Research project is a very complex task to fulfill. It involves physical, psychological, mental and emotional aspect of each individual. Being patience, time management, courage, hardworking, sacrifice of time, money and energy which could not explain by words are all needs to have during making the research. It involves multi-tasking starts from writing a proposal, collection of data, analyze and conclude the result.

I would like to express my sincere gratitude and appreciation to my supervisor Dr. Che Rabiaah Bt Mohamad, my supervisor from School of Health Sciences, for her contribution of time, energy, ideas, supports to teach and guide me throughout the completion of this research. A lot of thank also to Puan Rahimah Bt. Anshaari and Dr. Lim Pook Khai who help me in validation of questionnaire.

Thanks also to everyone who help me directly or indirectly during this research project especially nursing students, medical statistician students, lecturers and my friends. Thanks for your contribution in helping me; your emotional and moral support, your understanding and your teaching also your guiding in making this research. Thanks for your cheers and tears until completion of this research and your constant encouragement. Only God could explain my regards to all of you.

**PREVALENCE OF PRIMARY DYSMENORRHEA AND
IT'S MANAGEMENT AMONG UNDERGRADUATE NURSING
STUDENT IN SCHOOL OF HEALTH SCIENCES, UNIVERSITI
SAINS MALAYSIA, KELANTAN**

ABSTRACT

This study was to determine the prevalence of dysmenorrhea and approaches taken by female degree nursing students in School of Health Sciences, Universiti Sains Malaysia in coping with menstrual pain. This is a cross sectional study and non-probability convenience sampling of 129 female students (19 to 35 years old) from Year one to Year four. A self-administered questionnaire was used to collect socio-demographic and menstrual data. Pain intensity for dysmenorrhea was measured using Visual Analogue Scale (VAS). Prevalence of dysmenorrhea found was 75.2% and mostly occurred ≥ 4 years (33%) and 29.9 % was not recalled. Pain was mostly occurs at the onset of menstruation period (65%) and lasted for less than 1 day (52.6%). It was felt in multiple locations but most commonly in the lower abdomen and lumbar region. Major symptoms associated with dysmenorrhea were abdominal cramps, irritability, headache, vomiting, diarrhea, frequency of micturition, constipation, as well as varying degrees of pain severity. Most respondents experienced mild to moderate degree of pain. Approaches taken to deal with dysmenorrhea were: consulting a physicians (22.7%), pharmacological (50.5%), and non-pharmacological strategies (93.8%). Medication was recommended mostly by friends (40.8%) and mothers (30.6%) and only took medication when became severe (49%). More than one-third of the respondents did not know which drug they took. Major non-pharmacologic measures were: hot compress (48.5%),

sleeping (74.2%), walking (12%), massaging (59.8%), listening to music (13.4%) and eating sweet foods (9.3%). Consulting a physician ($p<0.05$) was associated with the duration of pain and taking medication ($p <0.05$) was associated with severity of pain. Respondents should be encouraged to consult a physician and should be prescribed medication in addition to other measures to alleviate menstrual pain and shorten its duration.

**PREVALENS SENGGUGUT PRIMER DAN
PENGURUSANNYA DI KALANGAN PELAJAR IJAZAH SARJANA
MUDA KEJURURAWATAN DI PUSAT SAINS KESIHATAN,
UNIVERSITI SAINS MALAYSIA, KELANTAN.**

ABSTRAK

Kajian ini untuk mengenalpasti prevalen dan pendekatan yang diambil oleh pelajar perempuan ijazah sarjana muda kejururawatan di Pusat Pengajian Sains Kesihatan, Universiti Sains Malaysia untuk mengatasi sakit senggugut. Kajian ini merupakan kajian rentas dan persampelan '*convenience*' bukan kebarangkalian terhadap 129 orang pelajar perempuan (berumur 19 hingga 35 tahun). Mereka diberi borang soal-selidik yang berkaitan dengan sosio-demografik dan menstruasi. Tahap kesakitan senggugut diukur dengan menggunakan Skala Analog Visual. Prevalens senggugut yang diperoleh ialah 75.2% dan kebanyakannya berlaku ≥ 4 tahun (33%) dan 29.9% responden tidak ingat. Kesakitan kebanyakannya berlaku semasa kemuncak senggugut (65%) dan berakhir kurang daripada 1 hari (52.6%). Ia dirasai di pelbagai bahagian tetapi kebiasaannya di bahagian bawah abdomen dan lumbar. Gejala utama yang berkaitan dengan senggugut adalah kekejangan abdomen, mudah tersinggung, pening kepala, muntah, cirit-birit, kerap buang air kencing, sembelit dengan pelbagai tahap kesakitan. Sebahagian besar responden mengalami kesakitan dari kurang ke sederhana sakit. Pendekatan yang diambil untuk mengatasi senggugut termasuklah berunding dengan doktor (22.7%), cara farmakologi (50.5%), dan strategi bukan farmakologi (93.8%). Sebahagian besar ubatan yang diambil adalah disyorkan oleh kawan (40.8%) diikuti ibu (30.6%) dan responden hanya mengambil ubat apabila

kesakitan menjadi teruk (49%). Lebih daripada satu per tiga daripada responden tidak tahu nama ubat yang diambil. Sebahagian besar cara bukan farmakologi yang diamalkan adalah: kompres panas (36.4%), tidur (55.8%), berjalan (6.2%), mengurut (4.5%), mendengar muzik (10.1%) dan makan makanan manis (7%). Berunding dengan doktor ($p <0.05$) dikaitkan dengan tempoh kesakitan manakala pengambilan ubat ($p <0.05$) dikaitkan dengan tahap kesakitan senggugut. Responden digalakkan untuk berunding dengan doktor dan perlu mengambil ubat yang dipreskripsi selain daripada cara bukan farmakologi untuk mengurangkan sakit senggugut dan memendekkan tempoh kesakitan senggugut.
